Devfloprmant of Mineral Wraith in Aaizona by Govmrament.-A private letter by Gen.J. R. West, dated IIart's Mills, Texas, August 1st, to a friend in San Francisco, has the following important inteligence:

Say to the gentlomen in feet, that it has been stated every way but officially yet, that I am to command a body of troops whose special mission, while exterminating the Apaches will he to settle and develop the mineral wealth of Arizona. This wenlth is almost fabulous. I had proposed writing you what had been officially communicated to me in regard to the recent gold discoveries near Tacson, but as I may prob ably visit that section of the country ere long, I will defer doing so until I can give you my personal experience. In my opinion, Arizona will yet startle the world as much as ever did California or Wishoe, with mineral wealth.

## DISCOVIERIES IN CHEMICAL SCIENCE.

Discoveries in chemical science, for the past few years, have followed each other with such rapid succession, that the working chemist has almost ceased to be surprised at any announcement of new discoveries in that branch of research. His chief ambition seems to be that he too may be fortunate enough to be able to announce some important fact, which shall place his name conspicuously upon the roll of discoverers. Indeed nu chemist of the present day considers himself entitled to much consideration until he has made an actual addition, in the way of some valuable discovery, to the domain of his fororite science. So far from perfection is the science of chemistry supposed to be at the present time, that an eminent chemist has recently remarked that there is a future, and a no very distant one either, at which the present notions on the subject will be regarded with as much ridicule as we now regard the attempts of the alchemists of former times to produce gold by a combination and manipulation of the baser metale.

It is scarcely sixty years since chemistry assumed a place among the practical arts, yet its influence upon the commercial interests of the world is already immense. Instances are not unfrequent where important industrial. pursuits in one country have been entirely destroyed by the chemical skill and industry of another.

The manufacture of beet sugar, at one time threatened to overturn the industry of the Antilles, and might indeed have succeeded had not taxation come to the aid of the latter. Beet and sorghum sugars, owe their very existence to recent discoveries in the laboratary.

The gas works of Europe hiave destroyed the monopoly which Egypt once lield in the manufucture of sal ammoniae from camels' dung The chemist bas tanght us that the refuse of gas manufacture contains this salt in abundance.

Sicily, until recently, derived large revenues from her exports of sulphur to England and France for the manufactnre of snlphuric acid. The chemist bas now taught the ore smelters of those countries that they can readily and cheaply' obtain alt they require of this acid from their pyrites and sulphurets.

Europe, within a few years, was lamenting the destruction of the forests of Russia and America, as likely to prove a serious draw back to the manufacture of potash, a rapidly growing necessity. The anxicty on that point was promptly met and allayed by the chemist after some considerable experimenting, who showed that an inexhaustible resource of that description might be found in the refuse of the beet sugar manufacture and salt marshes all over the world.

It is but a very few months since we have witnessed the introduction, upon a commercial scale, of a large series of ordinary articles in domestic use made of a metal, (aluminum or the metal of clay) which is of itself of quite recent discovery, and which until within a few months has been so rare as to be regarded as a valuable curiosity. The present abundance of this metal is purely the result of recent clicm-ical-investigations and discovery: It is only since the conmencement of the present year that we have heard of the great commercial value of the discovery of a method of abtaining the most brilliant and valuable colors from so unpromising an article as common coal oil and tar, and their application in connection with dyeing and calico printing. An entirely " new : mètal known us "thallium" has quite recently been discovered, for the honor of which discovery, two distinguished chemists are even now contending.

But a very short time ago, a work on practical chemistry would have contained no allusion to aniline or benzole; paraffine, aluminum or thallium. Now these substances, with the exception perhaps of the last, are materials of large manufacture and a work on chemistry which should now be published without treating upon then, would be considered very imperfect. Judging from the past, we may reasonably expect that there are numerous substances now known only in the laboratory which will, ere long, become familiar in the factory.
Our own community is even now agitated with the disdiscussion of what is assumed to be a. nost important discovery in the way of a fluxfor smelting copper: : We have before us the mostindubitable evidence of the discovery of a riaterial, the component parts of which, to be sure, are yet unknown, but which, when employed in a crucible, in a laboratory process, produces the most astonishing resuits as a
flux for separating copper from its ores-effecting with many
varieties of ore, at one operation, the same results which have heretofore required from four to six or eight different smeltings. The annonncement of such a discovery, as may well be supposed, is received with many misgivings ; yet, with the past before us, we ought not to be surprised at anything, and may be reasonably hopeful, that this present discovery may result in all that is claimed for it.
Chemistry tou hes no art or industry without giving it an enormous impulse. It seems now a matter of the utmost astonishonent how mankind existed withont it until the present centary. The very progress of civilization seems n. W ompletely dependent upon it, and yet, as we have al ready said, it is but in ite infancy. What may we not expect from its future development !

## ERRICKSON AND HIS MONITORS.

Soon after the breaking out of the present rebeliion, the Government at Washington learned, from reliable sources, that the rebels were constructing an iron-clad war steamer at Norfolk-the same which subsequently made its appearance as the "Merrimack.". It was well known that our navy possessed no ships which could successlully cope with this expected formidable monster. In this oxigency, the genius of Errickson was at once called into exereise to devise a match for it." The result of his efforts was the celebrated "Monitor," which, by a most remakable coincidence, arived at Fortress Monroe but a few hours, only; after the dreaded Merrimack had made her appearance, and, by her destructive powers, spread consternation through the entire llect of war ships and transports, in that vicinity. The result of the trial of strength which ensued has already passed into history; as one of the most resnarkable naval engagements which has ever taken place, and has had the effect to complelely revolationize the art of naval warfare. Since that time numerous other Moni ors, constructed upon precisely the same principles, have been been putafloat, and subjected to the severest tests known to inodern warfare. From the first, they have never failed to auswer their purpose. The problem proposed to be solved by Mr. Errickson was the construction of a vessel, which should present to the enemy the smallest possible target, practically impenetrable, jet-which should at the same time be uble to throw such a weight of metal as wonld demolish any antagonist previousIf existing, or which could be constructed upon any other principle. The Euccess of the effort has been most com plete. A greater trinmph of enyineering skill has never been placed upun record in the world's history.
When the first Monitor was bnilt, 11 -inch guns were the heaviest known to the service. Practical artillerists had no confidence in the possibility of constructing guns of any larger calibre, which could employ, with safety, sufficient powder 10 give the necessary momen um to the immense reight of their halls, required to make them effective. Capt. Errickson, in the first effort, succeeded in so shattering the Merrimac as to render her unfit for another encounter. But he was not satisfied. He proposed the use of 13 and 15 -inch guns, in o der to render his work more fully complete and speedy. Admiral Dalgreen, hief of the Ordoance Bureau, earnestly remonstrated against the plan as impracticable ; but Mr. Errickson, aided by Mr. Fox, the assistant but virtually the head of the Nary department, assumed the full responsibility of arming the monitors with 15 -inch guns. The success of this still farther innovation on the previousIy ealablished rules of engineering has been most triumphantly vindicated in the encouater between the Weekawken and the Atlanta, in which the latter most formidable craft was disabled and captured in fifteen minutes. The caprecity of a Monitor to resist blows was most emphatica ly shown wheil the Weekawken lay for a.l hour before Fort Sumpter in the vortex of the most terrible artillery fire ever directed by the hand of man. The Weekuwken is armed with two 15 -inch guns only, with which she has proved herself to be the most formidable battery ever constructed, and as safe fur practical use, as a common field ba tery. Had the original Monitor been armed with a gun of that caliber, the
Merrinac would have gone to the bottom in less than ten minutes aiter the commencement of her fight.

Increasing the Picific Naval Forcr.-The Governm nt is making every effort for the speedy increase of the Pacific naval force. Fourteeu hundred marines are being

MINING-ANCIENT AND MODELN-IN THE HARTZ
This celebrated Mining Region is a monopoly of the Crown of Hanover, and the shareholders of a mine-the virtual owners of the metal raised-must sell the same to the Government, at a price, which is usually from one fourth to a third below its actual commercial value. These mines contain some of the oldestworkiugs known-dating back 2000 grs. Ample written records still exist of operations carried on, seven and eight hundred years ago. Eividences of old Roman workings abound, in the frequent unearthing of bronze eagles and busta, known to have originated with that aivient people-mementoes that have come down to the presentage from an era of civilization between which and ours has existed a night of ten centuries, during which the light of civilization aud of arts had nigh become tatally extinguished. The-associations that cluster around these ancient workings ure most strange and interesting, and bring forcibly to mind the Bible description of miang in the days of the ancient Jewish prophets. In these mountains are individual mines whose earliest workings date back five hundred years ago, and which still yield a plentiful supply of ore.
The location of the Harte Murntains is guite isolated, and neither the people nor the general face of the country have undergone any material changes or modifications for centoies. Modern engineering science and the late improvements in mining machinery and sunelting operations find very little favor with this pecrliar people. Even the more eiightened classes, and those who fully appreciate modern mprovements, are not in furs of any change in this particular case, from the fact that ample compensation therefor is sup-
posed to be derived from the greater avaitability of labor among a people so stolid that not even the rush of the iron steed would avail to awaken them from their Rip-Van Winkle sleep of ages. Even the stean eugine, that most powerfiol and effective of all modern appliances for the drainage of mines, and other purposes in that connection, is viewed with disfavor hy this people, and, in a stubbown atherence to
old usages, miles of tunnels are run at an incredible amount of labor to gain a few feet of drainage, when by a mere moiety of the expense, the same object and more, could be gained quite as effectually by pumping.
In no part of the world could steam be applied for drainage more effectualy than here. The water does not flow into these mines from sprimgs, even when carried to a very great depth, but enters by infittration merely, and consequently at a very slow rate. Tlee most wonderful and laborious excavations, in the way of adits for drainage, to be found in the world, exist in these mountains.
In the more ancient workings, the excavations appear to have been carried on with very little engineering skill, und, consequently are very irregularly driven. Some of the ancient shafts reach to an enormous depth, and excite the atmust wonder as to the means employed in sinking them without the aid of gun-powder. That important modern invention is almost the only improvement over the ancient mods of working which has yet been introduced into these mines. The skill with which the older workings are secared, howet er, is a matter of admiration, even to the modern engipeer. These mountains contain almost all the minerals but coal, gold, silver, copper, lead and iron abound. The gold is found, as in this country, in veins of ruartz, intermingled in
various proportions with small ģuantities of the baser metals as in California. Auriferons pyrites occur in considerable quantity.: The gold is occasionally visible to the naked eye, but not nearly as generally as heré. . Argentiferous copper abounds, but the the silver which it contains is secured by a rery laborious and expensive process. Silver ore is obtained here in considerable quantities, and is smelted by botz the hot and cold blast.

Horrors of War-Loss of Ltfe--The present War of Rebellion, in this conatry, has been sanguinary enough to fillthe:whole land with mourning, and yet there have been wars far more destructive of life. It appears from the best historical testimony, that of one million two hundred thousand men emrolled in the armies of France in 1813, only 100,000 were alive in 1814, and that the loss of the Allied Powers in the wars with Napoleon was, accordng to the London Times, not less than, "ten million of men in the
prime of life." France, in the same period, lost about six

## THE MINING SHARE MARKET.

The Mining Share Market, for the week just passed, has been Ixceedingly dult, in part owing to the general apathy which has prevaled for several previons weeks, but in is great meaure in consequence of the general stato klection in which this city bas taken an unusual iuterest.
Burning Moscow, Nurth American, Daney, Baltimore American and sheba, have heen largely dealt in. The two armer at advancing rutes and the three lutter at a slight deline.
Uphir shares havo delined somewhat in consequence of iretty definite infurnation that the fortbcoming divideud will ut be increased.
Gould and Curry has advanced $\$ 100$ per foot.
Potosi hus matvaced to $\$ 1,000$, with fair demand.
Sierra Nevada, clused at $\$ 90$, a deline of about $\$ 10$.
Duney shares have met, with umaterial decline, with large dransuctions. The decline is attributable to auticipated reary assesaments.
Butcher has been less dealt in than last week, but at om what improved rates.
Burnng Muscow has met with a fair business at an adance of about $\$ 20$ per foot, but attended with considerable luctuation.
Overman is still improving and closed at a large advance ver lust weeks figures.
Xellow Jacket closed at a slight depreciation from last veeks ligures, baving been in fair demand.
Wide West Shaies bave been suught after, and easily wought at $\$ 115$.
Keal del Monte, is in favor with a fow and has been sold tsulu; but little stock offered.
C'tah, dull at 5 5̄ ; Pond, ut $\$ 35$; Fulls of Clyde, $\$ 5$.
Sheba, Humbuldt, has been more offered, and declined to 8120, alter selling at \$160.
Uncle Sann, Gold Hill, fluctuating from $\$ 82$ to $\$ 190$, and losed at $\$ 95$, with a weak Market.
De Sotu, but little enquired for.
We subjoin the principal sales of the week.

of the former is being offered; the impression being that stuck in such mines is yuite underrated in the market. The returns from foreigen shipments winch will suon begrin to come in fur varions mines, but recently opelled, and the result of the opreations of the simelting Wurks at Antionh, which will be hearu trom in the course of the present month, will, no doubt, soon exert an important inducace upon copper stocks.
Considterable interest is being manifested in this new branch of California maning, in Finstern cities, particularly in IBuston, where the press is devoting special attention to the subject. The large amonut of ore alreadygoing lurward and the encouraging prospects for the future give the earnest of early and full return freimhts, from this port. 'This important feature is being doly appreciated by our friends at the Liast.

A sale of a claim in the Lancha Plane Company, is reported the past week, ss huving taken place in Stockton, at 6,000 (claim 300 feat.) The Koystone is held in that market at $\$ 130$, with but a limited supply offered.
Reports from the Nothern couvties state that the location of copper clains is still going on as much as ever. Tho work of develupment is also progressing. The Union Company are taking out ore in considerable quantities, and preparing it for shipring. They will not send any forward until they have about 100 tons, as they intend to ship it to the Eisst themselves. They have a considerable amount now ready for shipment.
There are as many as a dozen mines in Klamath and
Humboldt counties that expect to be ready to ship ore very soun.
The Well Lead, in Nevada county are taking out large quantities of ore. They are sending the in inferior qualities only to the smelting works at Antioch. They retain their first class ore at the mine for shipment to the East. T'ney have a contract for the delivery of 1,000 tons of low grade ores.
The Last Chance has considerable rock out and will soon commeuce shipping.
The Burra Burra mine, two and one half miles south from the Well Lead, has a shaft down fifty-one feet with good infine chimney, of small dimensions, but gradually opening out of black oxide, from which some I50 lbs. bave already been taken. The same presents a most promising indication of a stroug lead of sulplurets, which they will duabtless strike soog.

CURRENT OF THE NIAGARA FALLS.
The immense force of the current in Niagara river, near the suspension bridge, is strikingly illustrated by one or two facts reluted by a gentieman who attempted to sound the river at that point. We may remark bere that the current is so strong that the river cannot be sounded at that point, and probably never will. The attempt referred to was made with an iron of alout ten pounds weight, ano attached to a No. 11 wire, all freely suspended, so as not to impede the fall of the weight. The experimenter says: "I let the weight fall from the bridge, at the hight of two hundred and twentyfive feet. It struck the surface fairly, with the point down, and must have sunk to some depth, but was no longer out of sight than a second, when it made its appearance again on surlace, about oue hundred feet down the stream, and skipped along like a chip until it was checked by the wire. We then commenced havling: in slowly, which made the iron bounce like a ball, when a cake of ice struck it and ended our sport. I am satisfied that no metal has sufficient specific gravity to pierce that current, even with a momentum acquired by a fall of two hundred and twenty-five feet. The velocity of the iron, when striking, must have been equal to one lundred and twenty-four feet per second, and consequently its momentum was near five thousand pounds. Its surface opposed, to the current was fifty superficial inches. This will give an idea of the strength of that current, and at the same time hint at the Titan forces that have been at work to scoop out the bed of the Niagara river

REESE RIVER MXNES.
Reports of a most favorable character continue to reach us from the Reese River Mises. Probahly no section of our widely extended mining region is attracting so much attention at the present time as this.
Some idea of the rush to this region may be formed from the following item clipped from the Reese River correspondence of a city contemporary, writing under date of Aug. 17,1863:-
Of the conutless number of gold and silver mines supposed to exist, not jet discovered, in that vact region' of country, comprised between the Rocky Mountains and the Pacific, few regions or districts seem to be attracting so much attention and causing such excitement as that of Reese River, the mining
headquarters of which is Austin. One of theigreat troubles here seenis to be the want of additional stage facilities to accommodate the rush of persons conning to this coun. try- Notwishstanding that this Overland Mail Company, which employs over 200 stages and mumerabl- horses and mules, on a line 1,915 miles in 1 n ath, running directly through this town, where they land from six to twelve pasvengers daily, there is seldom a day. when the stages leave Virginia City t at there are not from three to six passengers left behind. To secure a passage on any particular 'day, it is necessary to register one's name three or four days ir advance,
Eleven four-ox teams laden with machinery for Reese River, passed through Dayton August 27.
The Virginia City Enterprise of August 23d contains the following item :-
There is on exhibition at Lewis \& Spaulding,s saloon, under the International Hotel, twenty specimen bricks of bullion from the Reese River mines, produced from the following claims: From three tons of the Florida claim, from unassorted rock, $\$ 2,573$; from ten tons of the Morgan \& Murry claim, uuassorted rock, $\$ 3,18140$, from two tons of the North Star rock, nuassorted, $\$ 554$. The above rock was worked through the mill of Messrs. Buel \& Co., at Austin. Two more mills will be in operation in Austin, in about a week.
The Former of this city, of Saturday last, says that a quantity of ore recently brought down from the Dacotah Ledge, a-sayyed by G. W. Bell, yielded $\$ 4,99150$ to the ton.

A recent crushing of two and a half tous of rock from the North Star ledge, at Buell's Mill, in Austin, yielded \$500. The crushing of $21 / \mathrm{e}$ tons from the Florida ledge at the same mill yielded $\$ 1980$.

## CALIFORNIA TOOL WORKS !

John Weichhart,
All Kinds of Edge Tools, Etc.,

A Parisian inventor has off red to the P0-
lish Conmittee a new surt of fuluinant, which mill explude afir being un hour under water. These bumbs can be made in the midst of the woodd, with urdimary materiuls, and at low price, and it is said that many persons might be injured by a single discharge.

A New Londou man bas invented a weapon that may be iuserted in the handle of a ludy's parasol, and will drive a ball through au inch und a half plank at the distance of ten rods.
A Bertrsir officer has invented a new rio fle ball, charged with solid phosphorus.Whes lodged in any object it burns with great fierceness for sume time.

Anotuer Fall at Niagra.-The St. Catherine's Journal says that on Suturday night, the 18 th of July, with a sound louder than the discharge of a park of artillery, a large section of the rock on the north Cauada side of Niagara l'alls, near Mr. Iavis's 'I'able Rock Hotel, fell into the yowning abyse below, giving the Falla on that side a more decided hurse-shore appearance than they had befure.

Eye, Far and Throat.

## REMOVAL

The Office of the Mining and Serentific Press, has been emoved to Rooms Nos. 56 and 57 Government House, corer of Washington and Sansome Streets. We have been hduced to make this change of locution, not only with the fiew of securing m.re room and better accommodations for urselves, but chiefly to better accommodate persons having posiness with the office. Our location is now central, easy access, and in the direct way of the chief travel of the ty to and from the Post Office.

## DEODORIZING COAL OLL.

A Patent has been taken ont by a London chemist for a rethod of removing the offensive odor from coal oils. This rirable object is effected by means of nitrous acid in cominstion with slureads of iron, and the gas so formed is causIt pass into the bottom of any vessel containing petroleu, until the entire mass is completely saturated, when the ssel containing the oil is closed, until, by testing, the sames are found to be free from any ofiensive odor. This deforizing process is also capable of being applied to the oie connection with the procesis of distillation; so that the me may be introduced lirectly from its crude state into an orless oil. The invention is a very important one, and the all oost of its application must soon render its use univerin the manufactare of coal oils.
Directions. for usina Kerosene Lampg.-Tbe Board of palth of Brussells give the following, among other direcas, about the proper care and mode of using kerosene or troleum lamps:
The lamp should always be kept hermetically closed, for enever there is an opening that adnits a direct communifion between the oil-holding receptacle and the flame lamp ought not to be used, as an explosion may ensue. e receptacle may contain more petroleum than is sufficient one burning, and should be made of glass or other transent material, so that the quantity of liquid in it may be ily ascertained. The foot of the lamp ought to be broad if heavily weighted. 80 as to give it greater stability, and vent its being easily upset. Care should be taken, belighting the lamp, to see that there is a sufficiency of peleam in the receptacle, and should if, nevertheless, be ramed earlier than expected or required, the flame must first extinguished, a.d time allowed for the lamp to cool,
fure refilling and lighting it again.
Howd Pocier.-The Pacitic Company at Grass Valley, elack a pocket in their quartz lead of almost pure gold on ${ }^{1}$ day' A ugust 28 th, from which about $\$ 17,000$ were taken ij few hours. The gold was clean enough to take to town apnce, without going through the ordinary process.

I Regular Express has been started between Aurora ( $\mid$ y and Owen's River. It must prove of great convenience tharties at either end of the route.
[umboldt Salt. - The salt company's workmen have come u a a bed of salt, in the marsh, white as any table salt, and 3) particles, crushed in the fingers, crumbling out as fine. Il equires no grinding.

## THE BEAUTIFUL SKY.

It is strange how little people in general think or know The steamer Brother Jonathan which arrived from Victoabout the beautiful sky over their heads. It is the part of ria on Monday brought down a large amount of treasure and creation in which Nature has done more to please and bene-most encouraging reports with regard to the yield of the fit man than in all things else. In no other work do we see mines in Cariboo. The amount of gold duat by this amival the hand of a great and all-wise Creator so unmistakably is about $\$ 440,100,135,000$ of which was from Oregon. About displayed. The beautiful sky seems to be spread out like a $\$ 200,000$ of this amount belonged to three miners from Carigreat book in which man, in all conditions, whether civilized boo. These reen employed last year about 20 men in opeáor savage, may read, as in letters of fiee, "the hand that made ing theirl mine, and began to take out gold in January last, it is Divine." In no other work of God is the beautiful and taking out in a single day as high as 108 pounds, but averaguseful so intimately blended. The great essential purpose of ing per day 100 ounces. They deposited their treasure in the sky might have been accomplished by the sadden con-the Mint.
densation of a great black rain cloud, once a week or so, The reports from Cariboo are very interesting. Much exwhich might have been emptied of it\& wâters for irrigating citement had been caused by the discovery of rich auriferons purposes, and then a blank colorless waste have continued quartz veins. A correspondent of the British Colonist, says until the next fall of water was needed. But not so did the on this subject :
Almighty parpose when he made the firmament, and "divided Wihin the last few days some very promising veins of rich the waters which were under the firmament from the waters quartz have been discovered. All of these discoveries tho which were above the firmament." Instead of such dreary undoubtedly rich and extensive have been almost totally monotony there is not a moment of time in which the great eclipsed by a discovery made yesterday. Joseph Pearce, an book over our heads is not changing its face. Page after two days ago. While searching for them, he found a vein page passes before us, beauty alter beauty, picture after pic-- of white quartz, about two miles from Richfield. He worked ture sweeps across the sky in a never ending series of ex- at the vein fur two days, cleaning off the moss and vegetaquisite glory-the Creator talking to his creature, teaching ble mould, and the result of his labor was the discovery of him to look up from the groveling scepes of earth, and to The speeimens taken from the ledge are studded with gold read in the beautiful sky the lesson of immortality and life and silver, and the usual concomitant, inon pyrites.

## beyond the grave!

The reason why, in a clear atmosphere, the sky is blue, is thus pbilosophically acccounted for:
The white light of the sun falls upon the eartli without change; it is then reflected back by the earth, and as it passes through the atmosphere portions of it are returned, and this double reflection produces a polarized condition of light, Which imparts to the vision the sensation of a delicate blue. What is meant by polarized light is, that light which has been subjeet to a compound refraction, and which, after po-
larization, exhibits a new series of pheromena, differing materially from those that pertain to the primary conditions of light.

Amertcan Mrchanics in France.-One of the most ex tensive India Rubber Factories in France is located about three hours ride from Paris : was built by the father of Louis Philippe and employs from 600 to 700 hands. The establishment is now owned by a corporation. The most interesting (to Americans) circumstance connected with it is the fact that three American mechanics hold the chief places of superintendeney in this great French Institution. This is a fact which speaks eloquently in fayor of the superior mechanical skill of our countrymen:

Mars like tere Earte.-Recent examinations of the planet Mars, show it to be very similar to our globe. Snow is seen at both poles, the white circle increasing in winter and decreasing in summer. A greenish belt, with bay and inlets, is at the equator, supposed to be a sea and a redish island in that sea has been detected. The heat and light of the sun are only hall what they are on the globe ; but this may be compensated by a difference of atmopliere in their faThe gradnal appearance and disappearance of suow

As might well be expected, this discovery caused considerable excitement; and has led to quite a rage for quartz prospecting. Several other ledges, of supposed value have been taken up. This, like all such enormously rich discoveries, is probably notring more than a "pocket," which will soon be worked out, and leave the bolance of the vein, perhaps bolow paying value. Such extriordinary rich deposits of gold; are never very extensive. A discovery equally as rich, or more so, was made in Oregon some three or four years ago, which created a great furor at the time, but which was soon forgotten: I Cariboo correspondent of the Victoria Chronirle, after admitting the possible richness of this discovery, says :-
"If nothing further of importance is 'struck' in Cariboo in the next month or two than is now known, I think that the population of the country will be less than it is at present; the trade of the country will be less, and merchants generally will feel that times are dull and hard."

The" Lima."-The claims of the Lima company are situated two hundred feet in the rear of the Chollar works. The ledge is a good one, is sixty feet wide, and on the "Comstock range "-three very good points in this country. It was located two years ago, by Billy Chollar himself. The company are sinking a shaft on it, which has now reached a depth of 170 feet. The stock, which is nearly all owned in San Francisco, has never been thrown upon the mrrket. As the Lima is begining to excite some attention here, we shall probably hear of it oftener in future.

Tge Shera company, contemplates expending about $\$ 150$, 000 , in ascertaining more definately the contents of their mine and the shape in which it lies.

## THE REESE RIVER MINES

The Reese River Reville, in speaking of the Mines rhere says: "Just think of it-more than 100 ledges already known in this one district which will pay, and pay largely-from $\$ 150$ to $\$ 1,000$ per tor The stuff is universal-all around in tbe most uppromising ledges and out of the way places. This is the country for poor men; any sort of a clain from one inch to twenty feet iǵ widhh will furnîgh pay ore right from the surface-will pay its own expenses and those of all connected with it, if worked.? What more could be asked? Rich is no name for it ; the country is positively "seedy" with it, and all available. But it is not proper for us to brag; We only ask skeptics to call and see for themselves, like all sensible men are doing."
The same paper in speaking of what the mills are now doin that region, घays:
Brooks is now crushing; his mill appears to work to perfection. The Pioneer Mill and Mimily Company lave obfained a site for their extensive mill in the canion below town, and have a number of men engaged in grading and preparing the foundation. Their machinery, timbers, etc., will arrive here in a short time. The Union Mill Company, just above, have received all their machinery, and are putting the mill together at.ar rapid rate. They will be winder way in ten days. Hildreth \& Co. are making good headway,
considering the staunch manner in which they are doing considering the staunch manner in which they are doing
things. Buel. \& Co:'s' mill is busy pretty nearly all the time. The Oregon Mill Company have a large foundation up aud are rushing things along.

One and a half tons of ore from the Union No. 2 , worked at Buel \& Co's mill, yielded $\$ 450$, or $\$ 300$ per ton in siliver. The 'body of ore from which tbis lot was' taken is not less than six. feet wide, and increasiug rapidly in breadth.
San Miguel rock, worked at Buel \& Co.is mill, yielded $\$ 114$ from 480 pounds of quartz-silver, 981 fine, with gold $\$ 144$ per ounce. This would be about \$475 to the ton.
F. Davis's water power arastra mill at Cañon City has
been crushing the common rock taken from the Harding it been crushing :the common rock taken from the Harding it
Dickman ledge at Austin, which yielded 38 pounds of vullion to two tons of rock, or $\$ 392$ per ton. The next batch of rock to be worked will be from the Josephine, at Big Oreek, which has worked $\$ 518$ to the ton. Dwieri, MoConnebay \& Co. are talking of establishing a mill at Cañon City. A mill has been commenced below, at Lander City.
Ten pounds, less three ounces, of Yankee Blade rock, first location, crushed in an iron mortar in Gardiner \& 'Clough's office, yielded $91 / 2$ pounds of hard amalgam, which, retorted, gave $181 / 2$ ounces of silver, worth $\$ 125$ per ounce.
Oregon, Seymour, Blue, Washington, Magnolia and Florida, Manhattan, Ethan Allen, and a number of other claims above town, are taking out large quantities of rich pay ore. There seems to be no lack of quartz now ready to run almost any number of mills.
The success which has so generally attended the crushings thus far attempted seems to have inspired the miners everywhere throughout that region with renewed energy to apply thenselves vigorously in the development of their claims. We condense from the Revilie:
Work is progressing on a number of claims. Virginia tunnel will strike the ledge within 100 feet; Florence will run night and day very soon.
The developments in Unioa No. 2 are so important as to have a perceptible effect upon our whole mining district and the public abrond. On the surface it was not over a foot wide, but at a depth of 20 feet, where the shaft struck it, there is a solid vein of quartz 6 feet wide and an irregular formation of quartz for 6 feet more. The first 6 feet of quartz albounds in the purest oxide and chloride of silver, with other forms which make up the noted Mexican "Peacock ore," so very valuable.
One mille south of town, in the vicinity of the Union No. 2 , is the Congress, one of the older locations and on whieh considerable work has been done. The slaft is now down 30 feet, where it has passed through the quartz lode, developing a chioice quality of ore.
The Marshall cormpany have several tons of choice ore sacked ready for crushing. They bave the ledge opened in two places some distance apart, exposing a good sized lode of the utmost purity and value.
Springer and Ellis lose no time in the development of the San Domingo, in Springer Cañon. They bave a sllaft and incline down 30 feet, with a tunnel from near the bottom some 25 feet in. This mine, like all others southwest of town, contains the bromide ore in great purity and abundance. They have 10 or 12 tons out and ready for the mill.
Below this and toward the plain is the Mijuel, a Spanish
iscovery of undoubted importance An incline has been discovery of undoubted inportance, An incline has been
put down on it 30 feet and tie ledge taken out of this disput down on it 30 feet and tiie ledge taken out of this dis-
tance, It is the right kind of rock and is well defined and improving.
The Vernon Ledge, Smokey Valley, is now showing very
rich silver ore. An assay from the top gave 2 , 229 . rich silver ore. An assay from the top gave $\$ 2,329$. Workmen are tunneling in on the vein, and find the pay streak at least two feet wide-increasing.
least two feet wide-increasing.
Maggie Ledge, near Yankee Blade, is a new and valuable
discovery, the rock heing of a pure sulphide quality, and so rich at the surlace hat it has all been sacked up. Workmen are now down six feet with the shalt, but water has come in too strong to continue the effiort to sink it. Hence a tunnel
will be ran iminediately to top the lide will be ran iminedistely to tap the lode deep enough down to
drain it thoroughly. drain it thóroughly.
Die Vernon- 1 liis ledge, at a distance of not more than 12 feet deep, has been struck over eight feet thick, and this within gua-shat of the centre of Austin.
Gueen Brady is the name of a ledge north of the town, supposed to be the same as the Sonoma. It is undoubtly rich, as globules of silver appear all over the roasted or burnt rock.
The miners at Cortes District are busily engaged taking out very choice rock, quite similar to the rich ores of this vacinity. Androw Veatch is away beyond, north, exploring the country and risking his life as usual.

THE NEW STEAMSHIP " GOLDEN CITY."
The Pacific Mail Steamship Company is fast putting afloat a large and powerful fleet of first class steamers for this coast. The last of this fleet launched is the "Queen City," now on her way hither, The model of this vessel is much like that of the Constitution, but somewhat improved as to her sailing qualities. She is about the size of the Constitution, with engine driven by the same size of cylender- 105 incles diameter and 12 loot stroke. Her paddle wheels are 30 feet in diameter, capable of making $171 / 2$ revolutions per minute She is built with warter-tight bulkheads, fore and aft, dividing her into three compartments and is provided with 14 lifeboats; has 56 splendidly furnished double state rooms, and in every respect the vessel is superbly fitted up and admirably adapted to the Pacific coast.
Tre Sarail Francis Gold and Silver Mining Company has been reently incorporated for the purpose of mining and milling, and buying and selling mining claims.
They own and have title to two claims in Webster district, Alameda county, of 1600 feet each, besides 50 feet in the Avalanche, 40 feet in Saturn and Venus, 60 feet in the Champion lode, White Cloud Co., 5 feet in the Good Hope, 10 feet in the Pride of the West, 10 feet in the Henry Clay, 10 feet in Wood Choppert, 80 feet in the Glengary and 75 in the Gould and Hale, in all of which the work of tunneling is rogressing.
It would seem from the number of claims which they are aeveloping in the Webster, Alpine and Mogal districts, that they must certainly reet with suceoss, as they are not confined, in their operations, to the result of labor ou any one claim. One share of stock in the above named company represents a corresponding interest in all the interest of the company in the above mentioned claims.
Maing South:-A Los Angeles correspondent of the Sacramento Union, writing Angust 25 th, says that " 300 ounces of gold had just come in from the new placers, and that the excitement in that city still continued." Three hundred ounces, one would suppose to be a small amival to be considered worth reporting from a locality of such extraordinary reputed richness. All efforts to get up a large tide of emigration in that direction have thus far failed. It will be quite soon enough for such a movement when important arrivals of gold from that region are reported.
The same correspondent reports the arrival at Los Angeles of a large quautity of rock from the Slate Range district, from the Antrim and Comet lodes, which is enroute for San Francisco, and is said to be the richest. rock yet brought from that district, yielding in silver over ten thousand dollars to the ton.
Prof. Whitney, who has been spending a short time in this city, has again gone to the mountrina, in the prosecution of his geological labors. The rumor of his resigbation, as State Geologist, and acceptance of the Superintendency of the Latrobe Tunnel, at Virginia City, is withont foundation. It probably grew out of the fact that Professor Blake, formerly connected with the Geological Department of the Pacific Railroad Survey, has accepted that position.
The Latrobe Tunnel is one one of the heariest and most The Latrobe Tunnel is one one of the heariest and most important enterprises of that kind ever uudertaken in the State.
Winee, not Mines.-Our compositor, last week, made us give Mr. Hittell credit for a very valuable article on the Mrnes of California. Mr. H. has written many valuable ar= ticles on the great leading industry of our State, but the article to which we alluded, and which was published in the last Pacific Monthly, was upon the Wines, nat the Mines

## OWEN'S RIVER.

Considerable attention is being directed at the presen time to the Owen's River country, to the south of Carsn City. The Owen's River flows through one of the most de lightful valleys on the Eastern Slope of the Siema, Nevads The valley is about 140 milles long with an average width o about 10 miles. It is not considered mineral and has been brought under goverument survey and sectionalized. It i found to contain 592,040 acres, 200,000 of which is very su perior argicultural lasd. Owen's River takes its riselin Mo no County, about 40 miles south-west from Aurora. Th upper banks of this river contrin an immense amount of th finest timber in the world, which will soon hecome veiry val uable as a source of supply for the extensive agrienltural in terest which is soon to grow up in the valley, as well a for the mines which are lor ated along the base of the Iny mountains- throughiout its entire exstern border. At th southern extremity of the Valley is Owen's Lake, a beaut lul sheet of water into which thr river emptie: This lak is about 20 miles long by 18 brodd. The river, with sligh improvements, may be made navigable for a small class c
steamboats, at all stages of water, throughout the entin length of the Valley, and with the Lake affords a most act mirable chain of intercommanication from one extreme of th
Valley to the other. This Valley is from 4000 to 6000 fer below the summit of the Sierras, possesses a fine climat and is fast filling up with agriculturalists. The new comel express themselves as well pleased with the country, ari with the mining prospects around them, to which they 100 for a market for their produce. Vegetables of every kin can be raised in great abundance, as well as the cereals. N
further trouble is apprehenbed from the Indians, nearly all whom have been removed to the Tejon Reservation. Po tions of the Valley are covered, at the present time, wit most luxuriant crops of red-top clover, herds grass, etc., a the natural productions of the soil.
The most northern mining district, we believe, is the Iny is which about 1300 claims have already been recorded. Th Times, published at Anrora, in its issue of Sept. 5th, speaking of this district, says:-
"Capt. Peck of San Franciscois about to commence $t l$ erection of two furnaces; one for the Hooker compan and one for the Buruside company, which are desigued ; smelt the ores of these companies. [Argentiferoua lead or -Ed. Press.] Mr. Wingard has recently gone to San Fra cisco from Owen's River, and will forward forthwith, machi ery for a mill via. Aurora. The San Carlos company w soon have their mill under way. This mill is driven by w ter powex. Capt. Bosworth has arrived from San Francise and commenced crushing the Union company's rock. Th
company has out at least five hundred tons of rock. [A frier company has out at least five hundred tons of rock. [A frie
at our elbow says 1500 tons would be nearer the truth. Press.] Their ledge is from eight to twelve feet-wide, e taining large quantities of gold and silver, the former pi dominant.
The lda company are taking out fine rock; their ledge called the Nevada. De Bend City is the most central po tion and is improving very rapidly, The buildings are pris cipally made of adobes. The town has been recenty right angles. The blocks are 300 by 220 ; having an ally each of twenty feet. Many families from Sacramento, Vis. lia and southern counties are coming to the valley, and sen to be pleased with their new home. San Francisco is al sending her share of settlers."

The Visalia Delta of a late date, in referring to this gion, says :-
"A Steady stream of navigation is powring into the $O$ wel river valley. The abundance of water power, in close pir imity to the quartz leads, renders this the most desirable of tion we know of for miners. The farming land is being r idly taken up, and in less than a year we look to see an. dustrious population of thousands settled there."

San Bruno G; \& S. M. Co.-The claim of this compa is located near Silver City, and includes 1400 feet of gromi A shaft has been sunk to the depth of 80 feet and a led opened over sixty feet in width, of good pay rock. The co pany are about incorporating. The Devil's gate Disti will eventually be one of the best mining districts in the I

The Empirf Company, is located at Santa Cruz. 1 seen a letter from a reliable gentleman, formerly a broker this city, in which the mine of this company, is very far aaly spooken of. They have an inexhaustible amount of ro. easily attainable, which is estimated to be worth from '' to $\$ 40$ per ton.

## DOWN IN A COPPER MINE．

During our recent visit to Copperopolis we took occasion to look into the interior of the famous Keystone Mine．The Keystone is the first Northern extension of the Union Mine，the most productive and probably the most valuable copper mine in the world．It was uponground now belong－ ing to this Company where the first copper，upon the great Copperopolis lead was originally struck，and one of the main shafts of this mine has been named＂The Discovery Shaft，＂io commemoration of that fact．The Keystone is probably the most thoroughly developed copper mine in the State．It has been worked about two years，in which time over 1,000 tons of No． 1 ore have been shipped； 10,000 tons of No．2，raised to the surface and ready for concen－ tration，and from 12,000 to 15,000 tons of No 2 ，uncovered in the mine and all ready to be taken ou＇t with the expendi－ ture of a very small amount of labor．The present rate of shipment is not far from 200 tons of No． 1 ore per month．
The immense piles of ore and waste dirt heaped up about the main．shaft of this mine gives the visitor some idea of the vast cavernous openings marke below．Not satisfied， however，with this＂evidence of things not seen，＂on the invitation of the Superintendent，Capt．Richard Powning，or ＂Capt．Dick，＂as he is more familiarly known，we resolved on a visit to the interior of the mine．
We prepared for the descent by encasing ourselves in a complete mining rig，of overalls，blouse and slouched hat； then，with candle in hand，we followed the Captain down the ladder way，preferring that mode of descent to going down in the＂tub．＂The work upon the shaft which we de－ scended，having been conducted by different parties，who， from time to time，had been in charge of the mine，does not not exhibit the uniformity of design and engineering skill， which always should appear in a work of that character，and which，doubtless，would have been manifested，had Capt． Powning been in charge of the mine from the start．Much care and judgment should be employed both in the selection of the locality and in the manner of sinking and securing the main working shaft of every mine，and especially of a mine of such value and destined to be so extensively worked as the Keystone．The mistakes and imperfect engineering of the early management of this mine will yet have to be reme－ died at considurable cost．．Many thousands of dollars have been worse than thrown away on this work，in consequence of a lack of experience．The present Superintendent is making the best possible use of the work of his predeces－ sors．
The descent to this，like that to all other mines of any considerable depth，is by a succession of ladders reaching from one platform－to－another，at intervals of about twenty－ five feet，through which，in ascending or descending，the in－ dividual must pass by means of a small opening just large enough to admit of the passage of the body．From this shaft passiges upon the right and left，lead to the various galleries and dritts where the workmen are engaged in break－ out the ore from its place in the mine．In the present in stance，after descending abont 150 feet，the visitor begins to come within hearing of a confusion of sonnds，which come up from below－the noise of haminers striking upon drills， the stifled sound of the pick as the sturdy miner，deats heary blows at the crevices and yielding rock before him，the rat tling of the shovel as the hroken ore is raised from the drift and placed in the car or tub，preparatory to its journey to the surface or＂grass＂as it is technically termed，and human．voices，rendered strangely hollow by the echoes of those carernous depths，with now and then a dull beavy soind from a blist，fired in some adjacent gallery－serve to impress upon the mind of one，who for the first time fiuds himself in such a position，an indescribable feeling of wonder and astonishment at what he sees and hears around him． The glare of the feeble lights reflected against the black and dripping walls；the damp，cold，clammy and oppressive at－ mosphere of the mine；the pitchy blackness of the atmos－ phere and every thing else，a few feet from the candles，also serve to quicken one＇s perceptions as to the difficulties and dangers of mining ；while，notwithstanding the most deter－ mined effort to put on a careless exterior，a peculiarnervous－ ness will inevitably creep over the system－the infallible－off－ spring of an intruding doubt as to the safety of your posi－ tion．When you look around you，and observe the slender timbers，placed with so much care，as a support of the su－
perincumbent walls，the fear ineritably comes orer the un－ accustomed risitor，least those walls，of such immense weight
and extending，perhaps，hundreds of feet above you，should suddenly crush in their feeble supports，and bury you forev－ er from the light of day！You strive to smother the impres－ sions with an assumed feeling of awe and admiration at the spirit of enterprise and daring which leads the miner to brave such dangers for the accomplishment of the great pur－ pose of his calling－the extraction of the minerals，the sin－ ews of the earth，by which，wore than all other material things，uations are enabled to gain strength and importance among their neighbors，and accomplish migh！y results in the great march of buman progress！

While you are thus engaged in reverie，grand jet fearfu it is a source of the utmost relief that your guide，whose at－ tion has been engaged the while in some little matters 0 ， business connected with his care，suddenly calls your mind from its wandering and directs your attention to the busy scenes and interesting sights befure you．He takes you to the extreme end of a drift where the recent blows of the pick and hammer hare exposed the shining ore．The light from your candle，as you hold it near the walls，is reflected from a thousand sparkling＂pyrites，＂or reveals to your vision the masses of＂sulphurets，＂as they still remain，undisturbed，in the place where they were formed in the great laboratory of Nature．There they are，just as you have seen them in your little cabinet at home－the pyrites，the sujphurets，the hard grey ore，with here and there a small quantity of red or black oxides filling ap some little crevice，where they have been deposited by some of the chemical reagents which are in constant yet slow action all aronnd you．The carbonates hare all disappeared．They are always found near the sur－ face，and have long since been taken away．
You have now passed some distance from the main sbaft． Your guide takes you into a little side drift and directs your attention upwards；you hold your candle aloft and look up－ op into an impenetrable darkness！Your candle burus with renewed vigor，and flashes wildly；you feel a refeshing and invigorating draft，contrasting strangely with the damp at－ mosphere of the gallery which you have just left．You have ap－ proached an air shaft，which has been opened for ventilation． In ull extensive mines，properly opened，you will find various airshafts，and longitudiual air passages，by which a constant natural circulation is kept up，without the expensive and in－ coavenient arrangements of＂blowers，＂which always have to be put up in mines which are not opened with special re－ ference to this important particular．You will find such an arrangument－two or three of them－on the Union mine adjoining the Keystone．They make a great deal of noise， require a large amonnt of power，and after all perform their office of ventilating the mine very imperfectly．，A little of the right kind of knowledge，where two or more slufts are connected，will enable the superintendent to ventilate his mine without any such artificial means as＂blowers．＂The Keystone，we believe，is nearly one hundred feet deeper then the Union，yet the former is thoroughly ventilated by the sim－ ple control of a natural draft of air．Of course，under all cir－ cumstances，the air of a mine must be quite impure at best． But we have been standing quite long enough near this＂air－ hatt＂to become thoroughly ventilated．
Let us fullow our guide．Here we are again at the bottom of the ladoers，and our attention is directed to a windlass and bucket，just as we sometimes see them on the surface．On looking down we perceive that workmen are engaged in going down still deeper with the main shaft．The earth is hoisted from this extension shaft up to the＂dump hule，＂hy the windlass we have just noticed．To this＂dump hole＂is also brought the ore and water from the galleries and difts apon each side of the main shaft，and from this point taken to the surface．If we wish to go down into this，the lowest part of the mine，we shall find no ladders，but the visitor places one foot in the＂bite＂of a rope properly secured，and standing perpendicularly，holds tight to another portion of the rope over his head，and thus swings himself off the platform over the abyss below．The windlass man，then lets him down，in the same manner as he does the＂tub．＂Here we are，about 280 feet from the surface，in the lowest portion of the mine yet opened．From the bottom of this shaft gal－ leries will soon be run in both directions．The vein between this and the level ahore will be＂stoped＂out，the＂ladders＂ extended down，another＂platforia＂built，and the windlass men again go un sinking；and so on down，down，deepe $\mathrm{r}_{\mathrm{r}}$

## nd deeper，ns long as the mine will pay in depth．

But our adreuturers as well as oar readers are getting quite exhausted；so witlout seeing half the sights in to e mine，or exploring half its galleries and drifts，ie will make the shortest possible way to the surface by an immaginary ride to day－light in the＂tub，＂which in this case，harpens to be worked by a horse－whim，and of course hauls us up more slowly then a steam engine would．Perhaps befure we go down again，Capt．Powsin will have bis engine in operation， which，as we energe to the duy light，we see a lew feet in front of the shaft almost ready to＂fire ap．＂

## THE MINING SHARE MAREET．

The depression in the Mining Share Market，heretofore， of late noticed，still continues．So great，indeed，has it be－ come，that it has already resulted in an evident disposition on the part of capitalists to call in their Yoans and reduce their risks on this class of stocks．The causes uf，this de－ pression are not attributable so much to ayy lack of confi－ dence in the ultinate success of the leading mines as the prospect of an endless litigation which seems to hang over them．

There appears to be a fatality，in this respect，which has ever cast－a threatening shadow over the prosperity of Cali－ fornia in every thing which pertains to a question of title． This great incubus seems to have followed our citizens in their transmontane migration，with even a more threaten－ ing aspect than it ever presented on the Western Slope．It has nuw become the especial carse of our land，retarding out prosperity in its most essential point－the development of mines－thereby turning from this coast the flow of capital which would otherwise set thitherward with a volume and uniformity without parallel in the history of past commer－ cial transactions．It is difficult to determine to what point we are to look for even a ray of hope for escape from thia terrible infliction．There is evidently a radical defect some－ where－perhaps everywhere－in our Judiciary，in our jury system，aud amung the people at large．
Ophir has still further declined．The sales of the week have been rather Iarger than usual，but altogether on time． Contrary to expectations there was no increase in the divid－ end，which wus declared on Monday last．\＄48 per foot is still the figure．

## Gould \＆Curry is dull at $\$ 4,400$ on time．

The Oalifornia is still inactive，awaiting the results of the Latrobe Tunnel，which is progressing slowly，in consequence of the grecaution necessary to be observed to avoid damage from water，by striking the vein too suddenly．They are now very near the lead，and important developments may soon be expected．
The Central is about putting in a second pump，in connec－ tion with the California and Uphir．
The Chollar atill remains comparatively quiet ；few trans－ actions noted．The prospects of this Company are most encouraging in everything，save its lawsaits．Their works now going up are very superior and the mine rever looked better．
Putosi is still growing in favor，having met with a mate－ rial advance．This mise is an exception to the geseral de－ cline，and is now very firmly held at $\$ 1,500$ ．The probable postponement of the suits pending against this Company， coupled with the large yield of the mine for the part two months，is said to influence their stock very favorably．

Savage is not in much demand，notwithstanding the con－ tinued improvement of the mine Report says that the quality of the ore improves as the works increase in depth． The Company will not put up a mill at present，preferring to wait further developments in working silver ores which they anticipate will be available by next spring．The mine of this company has been proved rich throughout its entire extent， and is probably as safe for investment as any mine in Vir－ ginia City：The＂pay streak＂of this mine is represented as fifty feet wide，and as soon as they can make arrangements to have the ore worked to their satisfaction，they will take out 150 tons per day．

The Dick Sides met with quite a heavy loss in the burn－ ing of their engine honse，at the late fire，and some three or four weeks must still elapse before they will be able to re－ sume work．
The Best \＆Belcher，on the contrary mere gainers from the fire iwasmuch as it cleared their ground o certsin squatters， who had become quite annoying，giving them possession of
ground of which they will not agaiu be qquictly disposssessed. Wide Weat has fluctuated frum $8 i 5$ to $\$ 115$.

Heal lel Munte is in favor at $\$ 300$, byyer 30 days.
The C'unsulidation Antrim Company (Slate Range) is fa. rorubly mentioned. Sume fine epecinents of ore from this mine ure on exbibiton in this city. It is said that ore is now Leing taken from Antrim No. 2 which will yield $\$ 2000$ (perton. Rich aksays have heen obtained from ores found
in the Shate lango listriet, and it is attracting a good ceal of attention.
Aiorth American shares continue in favor, and have beet lurgely sold ; opened at $\$ 74$, advanced to $\$ 90$, and closed 3 3.4.

## Waltimore American, dull at $\$ 45$; Echo, at $\$ 50$.

## We subjoin the sales of the week.

## COPPER.

Copper still continues a matter of important enquiry "on ange" and everywhere else in mining or general basiness eles. The stocks of productive mines are constantly adncing with holders firm. The time required in opening out bopper mine, for sinking shafts and running levels, is as
portant to the value of the mine as a paying lode, and pes held to-day at $\$ 40$ to $\$ 60$ per foot, if well wrought, may rance within a year to much larger figures.
The Keystone has levied an assessment of $\$ 5$ to complete
thir machinery. The work of developnent is beiug pushed
iead at the expense of present shipments-the labor being lroted to that end.
The Nepoleon still continues its usual shipments. Sales "ore to the amount of $\$ 10,000$ have recently beeu made il the net monthly earnings of the mine now reach a handsue sum.

The shipments of the C nion now areruge abut 800 tuns per munth.
The Copper Hill Company are shipping about 100 tons per month. The Company is suid to be in a fluarishing cundition -hu stock in the Mu.ket.
The Table Mountain Company is still energeticatly at work developing their lude. Sales of this company's stock are repurted at sto.
In Sonsma county about fifty independent ledges have been struck, upon which it is estimated fully 1000 claims have twen located. The Woodland Company have struck promising ore within fifteen feet of tho surface. Twentr-tive feet in this company's claim recontly sold fur $\$ 30$ per fuot. One sale in the C'nion, an extension of the Woodluad, is roported at $\$ 400$ to the share, ( 200 feet.)
In El Horado county some rich strikes are reported, and the Home Coppor Company is said to have found good ure ut
a depth of $\overline{5}$ leet.
In Ilacer county the different companies are vigorously at work, and a considerable amount of capital is being expended.
In Nevada and Yuba Counties the interest in copper is continous, "without any appurent abatement. In some of the companies shares have risen to $\$ 100$ per foot. "Three or four companies have an abundance of ore averaging 40 per cent. of copper. The Prettiman, or Well claim, Eureka, Last Chance, and Stillhou e claims are the most valuable.
The copper mania is still. working its way northward Copper croppings can be distincfly traced from Del Norte and Siskigou counties from 60 to 70 miles into Oregon. The Dalles Jourant publishes correspondence from Masco county to the effect that the Martillut lead yields copper assaying as high as 60 per cent.; the Star lead is fully as rich. (Probably specimens.) The Stonewall lead assays $\$ 13$ in silver in addition to its copper yield ; the copperhead lead contains copper, silver and gold; the New Helvetie, containing silver and gold is as rich in copper as the Martillot. 'There are a large number of other leads, in the same neighborhood. The regular silver leads have also been discovered in this locality, which are elsembere more fully worked.
The Press of Victoria is also calling attention to the copper discoveries in that section. They warn their readers that gold deposits must soon cease to be renumerative, and that more reliable minerals must be sought.

The Colorado mines are also attracting an incresing degree of attention. The great importance of that region as a mining district claims special regard, being within our own territory, and possessing a traditional reputation. Reports of rich discoveries are of frequent occurence, both in placer and vein. The Apache Chief Company, it is -tated, have struck a valuable lead of copper, assaying some 60 to 70 per cent, and about thirty miles cast of La Paz.
All the ores from that quarter which have arrived in this city reach a very rich assay. If the mines of that region continue to any great depth they must soon become of great value There are rome reasons for believing that they will result much like the Similor ores which, for some years, have been found in such great abundance in Chile, but which, of late, have been giving unmistakeable evidences of an early exhaustion. It is to be hoped, however, that such nay not be the result with the mines of Colorado.
In Sunora, also, so far from abating, the rage for mines, both in copper and silver, is strongly on the increase. A recent correspondent of one of our daily contemporaries, writes from that region as follows :-

One operator, who had bagged only nine mines in a fortnight's run, was greatly chagrined to find that his friend and adviser had beaten the best ground and secured fifteen. He will probably be up on this steamer, disgusted with his ill lack. Let me here advise every one to be caitious of investments in cupper mines in the low lands or coast strips of So-nora-all experience, with scarcely an exception, having proved these veins superficial and comparatively worthless. 1 stepped into the Prefectura half an hour ago and recognized rich," which I examined by request of ex-(tiov. Cubilias five years ago, and which were then rejected as worthless."

Mr. Edrror: Tour correspondent "P" now promises that he "will not mislead your readers-' The question was, did he not do so in his letter of the 3d ult.; he still intimates not, and refers me to a work of Dr. Hoffmana's. I may say, en passont, that though I have cause to remember, with gratitude, the instructions I received from that eminent Professor, I should not have selected him as an authority on metallurgy, as I believe from the days of his studentship, his attention hàs been almost exclusively devoted to organic chemistry. But even Dr. Hoffmann is against "P." In Fowne's chemistry, the 7 th edition of which was "revised throughout " by Dr. Hoffmann, I find, after simple instructions for testing for silver with nitric acid and soluble chloride, with expostre to light, "Lead is the only metal which can be confounded with it." So mach from Dr . Hoffmann as to the practical question whether " $P$ ". is misleading miners when he suggests instead of the above, a delicata operation which, in the end, he says may be complica-: ted with antimony and bismuth. On the purely chemical part of the question, it is water and not bydrochloric acid which produces the subsalt of bismuth, which "P.". means and if too much water were added the free nitric acid would at once redissolve it-its formation is however obviated by the ase of enough acid: P. talks of "falling on me again." Your Cornish readers will understand me when I claim "the first fall" for
A. Poor Chemist.

San Francisco, Sept. 7th, 1863.
Bucheye Company.-This company, says the Territorial Enterprise, whose claim is located near Silver City, are now working their mine in a very energetic manner. Within the past four months they have opened their ledge in three places. In their north incline, which is down a depth of 170 feet, they have found good silver bearing quartz, but water came in so fist they were compelled to suspeud operations at this point. The President and Directors arriving here about this time, at once contracted for a 30 horse pewer engine to keep the mine free from water. When this is in working the compony expect to take out a large quantity of rich ore from this incline. The Superintenrich ore from this incline. The superinten-
dent a few days since discovered an old tunnel ranning in a distance of 90 feet, in which the ledge is found to be from 8 to 12 feet in width, the quartz bearing a resemblance to that found in Gold Hill. In twenty four hours' time 40 tons of this rock was taken hours time 40 tons of this rock was taken
out. The compary are confident that they cän, after a short time, raise from 500 to 1.000 tons of ore each month. They have all the conveniences necessary at the mine; krildings for workmen, powder-honse, office for Superintendent; etc. Roads are built of width and grade suitable for the heavest loads, asd nothing seems to be wanting to make this one of the best mines in the Devil's Gate District.

The steamer Constitution, for Panama took away 105 bags of Silver Ore, in addition to her large shipment of $\$ 1,454,207$ in treasure.

Telegraphic.-Ten thousand dollars have been subscribed in Humboldt and along the line, for the bnilding of a-telegraph to California. The line will be in operation in about three months.

Age of the Big Trees.-Professor Whit ney, State Geologist of California fixes the age of the mammoth trees forming the big grove of Trolumne at one thousand two han dred and fifty years.

SILVER DISCOVERIES IN OREGON.
The Dulls Journal publishes correspondence from Wasco county Southern Oregon, announcing the lact thut a large percentage of oilver luta recently been discovered to exist in the copper ures of that viciniy. In addition to silver in connection with copper, regular silver ores have also been discovered. The correspondent alluded to says that these silver leads have beeu discovered since the 1st of August, and that athough none of them had heen assayed, they have been sufficiently tested to warrant us in saying they contuin a large perceutuge of silver. Thesilver leads are known as the Barker lead, which resembles exactly the Comstack lead of Washoe; the Mammoth, the Home Ticket, the Fultu and Pioneer leads, we ane now prospecting, and as we go down, thay improve in quality.
A great draw on the mines of that region is found to exist in the lack of facilities of transportation. The miners are talking of putting up furnaces for reducing their ores to reguluc. They will find it a hazardous experiment, except it be done hy parties of the fullest experience: Much confidence appears to be felt in the future value of that region. If such anticipations are realized, on a proped development of the mines, neither capital nor facilities for tramspurtation will long be lacking.

Eye, Ear and Throat.

THE ONLTMINLNG, MECHANICAL AND SCLENTIFIC PAPER ON THIS CONTINENT.
THIRD YEGAR: VOLUME VI-NEW SERIBS!
A uew volume of this extensively elrculated paper
commenced Hept. 11, 1862 . It is intended that overy number shail be repleto with infurmation concerning Miuing, scicutific, Mechaniona and Industrial pursuita, togother with soveral original engravings, of new invontions, etc., prepared expressly for its columiss,
This paper is devoted to the above purposes, together
with the interests of Science, Arte, Agriculture and ComWith the interests of Science, Arts, Agriculture and Com-
merce, and any general information that nay be of th-
terest to the reador : and it is the intention of the propriotor to spare do paius or expense in making it equal in interast and valuable foformation to any paper yot published The Mining Interest I
Wil fid it of great value, as it will contain all the news apperlaining to Dining, tho prices and sales of Ma
ning Stocks, uew inventions of Machinery adupted to tist purpose, and of every thing generally that may be of service to the Mher.

> The Inventor!

Will and it an excellent medium for the purpnse of bringing his invention into notice, of ascerkainiug the progress of inveation in this and other countrics, and also of roceiving any information that may be necen-
mary in obtaining his patoot, the proprietors having had great exnerience as Patent Agents, together with faollgree at Warlhington that Buable hom to obtain Patonto
ith dispatelh.
The Mechanic and Manufacturer !
Will be greatly benesitted by its perusal, as its col-
umus will tron time to timo contau original engrave umus will trom time to timo contum original engrave
inge of new machines and inventions, toge ther with a
large amount of teading mutter appertaining thereth. large amount of reading mutter appertaining therem.
Wo aro constantly recelving the bebt acientific. jour-
nals from all quarters, from which wo shall couthue nals from all quarterg, from which wo shall couthue
To Chemists, Architects and Millwrights. This jourual will be invaluable. All new discoveries
 will be fouvd in our columas, The Farnoers and Plan.
ters will not be neglected, engravings will be given of agricultural implements, amd the farming intorest generally will beamply discussed.

## REMOVAL.

## The Office of the Mining and Sienentifie Presse, has been

 semoved to Ruoms Nos. 56 und 57 thovernment House, corner of Wawhington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing m re room and better accommodations for ourselves, but chiefly to better accommodate persons having bosiness with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Office.
## INVENTORS AID ASSOCIATION.

Ever since lobor-saving machinery has played an important pait in the production and development of wealth, it has been well known that many valuable discoveries have been kept long from public knowledge, by reason of the lack of pocuniary means on the part of inventors. It is not unfrequontly the case, also that important inventions are thereby entirely lost to the world. To obviate such an evil and to foster and encourage inventions and industrial pursuits generally, an Association has recently been formed in Paris, known as "The Society of Credit for Inventors," which has for its object the assistance of inventors, by fumishing those who have made valuable inventions, but have not the ability to bring them out, with the pecuniary means for doing so. The Association is a kind of Banking Institution and its action is regulated by two Boards of Officers; the first condsists of scientific and practical men who pronounce upon the trechnical value of an invention or improvement ; the second Board estimates the probable prospects of the same in a fimancial point of view. The two Boards, in conjunction, as they deem it necessary can call in competent persons, ex perts, with whom to advise in matters upon which the Board may not feel themselves thoroughly informed. Of course, the losses which must sometimes occur, will be met by the large interest obtained from successful operations.
Much benefit is expected to be derived from this Association, in the stimulus which it will extend to national ge nius, and national values which will thus be created in the field of mechanical research and-improvement. The idea, we believe, is new ; it is certainly generous and noble. Under its workings true merit can scarcely fail of its reward. We have often seen the need of such an inslitution. Indeed as we write, we have our mind upon some two or three inventions in our own State, of the most undoubted value which are remaining at rest, from the lack of means on the part of inventors to properly bring them out. Two of them are full of promise of the utmost importance to the great mining interest of the State. Of all countries in the world our own is most in need of such an institution. Such an enterprise, properly managed, could scarcely fail of being a good investment to stockholders, and a healthful stimulus to the genius for discoveries and invention so characteristic of our people.

## HYDRAULIC MINING.

We notice a well written and suggestive article in the ble, so as to be capable of couvenient use and at the same Sacramento $C_{n}$ non of the 18 th instant, on the general sun- time possess the eapacity of resisting the pressure to which joct of Mining on the Pacific Cuast, in which Hydraulic it is necessary to expose it. Any person who ean aceomMining is mentioned merely incidentally. Wonderful as are plish this object will do as much to advance placer mining, the developments which the writer of that article truly de- as McComick with his reaper has done to advance agriculture. scribes as being nabe in the search for the precious metals. There is money-there is fortune in the idea. A more worin their mative lodes of quartz, the deep placer diggings, now thy object for a leading prize at our State Fair could not be so extensively being worked by the upplication of hydraulic mentioned. power, are worthy of mor than a mere passing notice.
For the first few years after the discovery of gold in California, nearly all the precious metal was taken from surface, or placer diggings. Millions of dollars were taken out mostly from these shallow deposits. Of late years this class of diggings has been dropped by white men as anprofitable, and has now nearly all passed into the hands of Chi aamen.

As these shahlow diggings began to give out, the miners gradually opened up a new class of deposits known as "deep diggings," which are worked by a new process first introduced into practice in California and known as hydraulic min-ing-a process too familiar to most of our readers to need a description. The more shallow and most ensily accessible of this class of diggings were first aitacked, and with very good success, by a low pressure of water. As these diggings were traced further and still further into the hills, a larger volume of water was needed to break down the hanks, and a higher pressure, partly from the less yielding nature of the gravel and in part from the necessity, as the bank before the miner increased in height, that the pipe-man should stand at a greater distance from his work to secure safety from the caving down of the gravel, as he undermiued the same with his stream.
In order to meet this constantly increasing emergency, vaious devices have been resorted to for strengthening the hose so as to make it stand the desired pressure. Double and treble thicknesses of canvass have been employed at great expense, and galvanized iron hoops have been contrived for the manufacture of "crinoline hose," as it was termed ; the expedient of securing hose by winding it with small ropes has also been attempted, but all without any decided degree of success, for various reasons, which it is unnecessary to enumerate here. The developments of this branch of mining are most important and interesting, and the progress in that direction thus far, encourages us to hope for an almost uninterrupted extent of these deposits. Our deep diggings are very much like our quartz mines in the nature and immediate consequences of their developments-The more, thas far, we have opened thern, the more extensive are the proportions which they assume ; and even now more ground of this description has been proven than can be worked out in the next fifty years. At this time and forever henceforth, he cheif part of the gold from our placer mines must come, Amador, to make collections and solicit subscriptions for and from the "Hydraulic diggings." The only serious drawback Mining and Scientrfio Prrss. Mr. H., wha is a thorough to this class of mining is the difficulty encountered in ob- practical miner and well skilled in the use of the pen withall taining hose of sufficient strength to stand the immense, will also act as correspondent, and furnish much valuable inpressure necessary to prosecute this work with success in formation with regard to the copper mines of those important deep ground and in hard, cemented gravel. It has, for some counties. We bespeak for him a cordial reception from aur deep ground and in hard, cemented gravel. It has, for some counties. We bespeak for
two or three years, been held a desideralum of the greatest mlning and other fricuds.

## CALIFORNIA COPPER SMELTING WORKS.

The first result from the Copper Smelting Works at Antioch came down on Monday last in the shape of a bar of copper, the first copper ever obtained outside of a cracible, on the Pacific Coast. Any doubt which may have hetherto existed with regard to the suitableness of Mount Diablo coal for smelting copper has been removed by the success thus attending the first "firing up" of this furnace.
The field of success seems now fully opened to the Company, and the only obstacles in their way, other than those of their own creating, will be such as are always incidental to even:well understood undertakings attempted in untried localities and under ordinary changes of circumstances. The introduction of a new industry into the State, and one of so great importance and complexity as the one just initiated, is not to be fully accomplished except upon much thought and the exercise of the most mature judgement.
Too much credit cannot be given to the idifatigable Secretary of this company, R. W. Emerson, Esq., who has conceived and brought to a successfull state this important enThe stokholders of this company, are not the only parties who are interested in a favorable result. The entire California public are watching with much interest the developments which this company is making in a branch of iudustry, which if successfull, will open up an almost illimitable field for the employment of capital, and add millions of dollars to the palue of a most important class of mines, which are just now begining to be opened up among us.
There are numerous mines of low and peculiar grades of ores, already opened and to be yet discovered, which can never have any value except upon the hypothesis that the ore can be smelted here. Every mine property in the country is interested in the present experiment; as there is no mine which does not turn out much ore that will never pay either for shipment or transportation. The pioneers in this enterprise may be considered in the light of public benefactors. We shall watch with much interest the further development of these works.

Spfcial Notice.-Mr. Lege Harnett has been appointed our Special Agent to visit the Counties of Calaveras and

## OWEN'S RIVER CANAL COMPANY.

This company has been incorporated for the purpose of constructing a canal in Owen's River Valley in the Counties of Mono and Tulare, State of California. Its object and prospects are fully set forth in the following Prospectus just issued by the Company.
The principal object is to furnish motive power to work the vast number of Mineral Lodes, in the Inyo, and Russ Districts, (situated in the Inyo Mountains, on the East side of Owen's River, commencing at the foot of Owen's Big Lake extending thence northwardly the entire length of the Lake and (River,) also with a view to the transportation of wood and lumber, from the timber regions at the bead of Owens River, to supply the Mining and Agricultural wants of the country along the line of the canal and adjacent thereto.
The scale on whichi the canal is planned is sufficient to admit of its employment as a means of transportation. A careful survey has been made by J. E. Clayton, a compe tent Civil Engineer, employed for that purpose. A. Litho graph Sketch of his plan, and some brief statements based upon his report, or some extracts from it will give the reader some idea of the work, feasibility, costs, and results.
"I found," says Mr. Clayton, "the poict selected by Messrs. Lambeth \& Whigham for the mouth of the canal, exceedingly well adapted to taking the water from the river, commencing as it does at the southern extremity of an arm of the river, forming a natural canal for nearly one-half mile, and about one and a half miles above the new town of San Carlos, on Owen's River. The Arm or Slough, as it is sometimes called, bas high banks which are never overflowed by the highest stages of water. The river is very narrow, at its junction with the slongh or natural canal being not over sixty (60) feet wide, and the most feasible point for the construction of a dam on the river. You w ll find it marked on the sketch as Initial Point, showing the level of the river as found at that date-November 20, 1862 .
The singularity of this river is that it discharges a constant volume of water, being fed only by springs and the gradual melting of the snows, annually deposited upon the Sierra and Inyo mountains, whose tops rise to the height of 4,000 to 6,000 feet above the level of Owen's Valley, which is a beautiful valley formed by alluvial deposits from those two great ranges of mountains, and averages about ten miles wide, and 140 long. It contains by Government Survey, 592,040 acres, 200,000 acres of which is splendid agricultural land, all of which has been surveyed and sectionized, and the Plats returned to the Land Offices, at Visalia and Stockton, a copy of which can be seen in the Company's Office.

Through this valley flows the waters of the Owen's River, which takes its rise in Mono county, about 40 miles southwest of Esmeralda, on the Eastern Slope of the Sierra Nevada, and in the midst of a dense forest of Pine, Fir, Tamarack and Oak, which line its banks and extend back for many miles, showing that an unlimited supply of timber is here to be had for the country lying South, which is now destitute.
It then meanders through this valley, with a gradual descent of about 20 feet to the mile for a distance of 140 miles and empties its waters into Owen's Lake. It is said to be navigable for steamers of 75 tuns burthen, (after the contemplated improvements are made,) at the lowest stages of water, and will afford, at all seasons of the year, an unlimited supply of water for Mining, Milling and Agricultural purposes. And, unlike most rivers in California, the supply is greatest in the summer season, the time it is most nceded, and never subject to sudden rises, which is an admirable feature of this enterprise.

We will now show by facts and figures to all parties interested in the Owen's River Mines, the great advantage to be derived by every owner of "feet," and the owners of canal stock, when this great enterprise has completed the first five miles of the canal. The Stean Mills now working in Russ District, find by actual, experience that their motive power for a ten-stamp mill cösts $\$ 60$ per diem, or $\$ 6$ per tun for each ton worked, to say nothing of the many other contingent expenses, which are continually occurring where steam is used as a motive power.
The Canal Company proposes to furnish water for a motive power at one sixth of that cost, or for one dollar per stamp, and perhaps less.

According to the estimate of J. E. Clayton, the engineer of the Company, there?will be andficient volume of water in this canal to run fifty mills of 20 stamps each, making a total of 1,000 stamps. We have no besitation in saying that in a
few years, all the water to the full capacity of the canal will be required.

Allowing 20 days as the ranning time of the mills per month, one mill of 20 stamps, would give a monthly yield of $\$ 400,00$.
For 50 mills of 20 stamps,
. $\$ 20,000,00$.
Allow for salaries of officers and emplojees, re-
2,000,00.
The net result would be.
$18,000,00$.
or $\$ 216,000,00$ per annum.
The returns from the motive power would soon re-emburse the first cost of the work.
Other sources of income from the canal-transportion, irrigation, lumbering, etc., need only be referred to.

It is no stretch of the imagination to suppose that fifty mills, of twenty stamps each, will be in operation inside of a few years, when we turn to Washoe and see there, to-day, one hundred malls in operation, some of which have fifty stamps, and still more are being built.
We here quote from the Territorial Enterprise the following statistics :
"The number of Mills in Nevada Tervitory is 100, ranging from five to fifty stamps each, which are in constant operafrom
tion.
The
The following amount of treasure has passed through the office of Wells, Fargo de Co., at Virginia from April 1, 1862 to July 1, 1863.
For the quarter ending April 1, 1862,.......... $\$ 270,000$.
570,000 .
$800,000$.
956,000.
1,270,000.
1,600,000.
Total amount for the past eighteen months, \$5.466.000. Estimated amount of the yield of bullion on the eastern slope for the year 1863 :
Virginia City,
$.6,000,000$.
Silver City and Gold Hill,.
Empire, Ophir and Dayton,
Esureralda,
Reese River and Humboldt,
10,000,000.
8,000,000

Total, $\$ 30,000,000$. hipped to San Francisco."
It is confid + ntly asserted by intelligent parties who have made it their business to examine the mines, and the resources of all those vast mineral regions, that Owen's River is not second to Washoe in its future prospects and destiny.
To assure the Public that this Stock has an intrinsic value, and that the Company will be in a condition to pay dividends, at an early day, the trustees have set aside to be sold on account of the Company, 3,000 sbares of full paid, or unassessable Stock, and 2,000 shares of assessable, the proceeds of which shall be applied to the completion of the works.
The office of the Company and its place of business is in San Francisco, 328 Montgomery street. A. J. Downer \& Co., 406 Montgomery street, are the authorized agents of the Company, who will dispose of the Stock in such quantities as may be desired-and give such information to parties wishing to invest, as they may require.
We would here beg leave to call attention to the fact of the trustees haring set apart the one-half of the capital stock to be sold on account of, and for the benefit of the Company. It is obvious, that a Company with such large resources in in the way of marketable stock, will seldow if ever be obliged to resort to assessments to prosecute the work. In no case, is it reasonable to suppose that there will be more then ten per cent. of the capital stock called in by assessments, and that would be at such intervals and in such amounts as not to be felt by the owners of assessable stock.
Eistimated cost of ten miles of the work, as made by J. E. Clayton, civil engineer:
Dam in the river,..
\$2,500,00.
Lock and flood-gate...
2,500,00.
Iron and smith-work,
500,00 .
Lumber for waste-gates aud various other pur-poses- 30,000 feet, @ $\$ 150$ per 1,000 feet,
$4,500,00$. Excavating the first section of five miles to De Bend City -4 feet deep with an average width of 27 feet, 105,600 yards @ ,30,.
Excavating 5 miles, additional, to a point at the
Union Lode-105.600 yards @, 30,.
For improving the cañon 15 miles,
One Saw Mill, in running order,. .
Contingencies,
31,680,00.

improvements for 15 miles, etc.
$\$ 163,360,00$
It is manifestly evident that this Canal. when completed will furnish motive power for runing a quartz mill at a cost of not more than 25 per cent. that of steam power. This would be a saving to any company working a tea tamp quartz mill in Owen's Valley of full $\$ 40$ per day, or $\$ 800$ per month of twenty working days. This saving upon the cost of steam power would enable a company having a paying lead in that vacinity and a ten stamp mill propelled by water from this canal to make a dividend of one per cent. per month, on a capital of $\$ 80,000$, This additional. value of the stock of the mining company would give an enbancement of $\$ 40$ per foot upon a mine of 2,000 feet mining ground. The increase of value to the mine upon a large scale of operations can be readily perceived.

## [From an Ocousional Correspondeut.]

Virgitina City, Sept. 12, 1863.
On my way over here I stopped at the Zinc House Mines and was almost astonished to see some of the good looking ore beiug raised and sacked. The remembrance of a former excitement, of surface gold diggiugs in that neighborhood, had prepared my mind to doubt all their pretentions. I obtained a few feet in two different locations in which some of the leading Bankers of Sacramento City and Nevada County are owners.
I was sorry that I did not possess an agency for your paluable paper, whose claims I ably adrocated, and no less than two parties promised to raise a subscription clab and send on.
I had a clipping in my memorandum book, on "Copper Ores and Prospecting for Copper," that would really have been worth to some of them the whole price of one year's subscription.
An old lady friend was eager to know if a certain heavy specimen she exhibited to me was not silver ore.

The application of a pocket magnet showed unmistakable indications of iron. At their mine near the House, were three classes of rock saved separately and each class suspected of being mineral and perhaps rich ; but in what metal they knew not. Why all this suspense and laboring in doubt, when by their using the plain instructions given from time to time in your paper, and by an outlay of not more than one dollar for chemicals, they can make scores of tests as to the quality or kind of mineral they are handling; and by a little practice will find it sufficiently accurate as to qual ity for all purposes of the prospector? You need a good traveling agent all the time on the miners' trail, or rather I mean the miners all need just the information given in the Scifntific Press, and I fear will not know of the paper only through an agency.

I would hiut that it is my opinion that the Pocket Magnet could be used much by our prospectors, where it is nop used but little. For example, in my little trip over toward Walker River, S. E. of Virginia City, about 38 miles, in the new district called "Silver Lake," I carried only a small horn and a small pocket magnet.
During the first afternoon, I and a companion from jour city, visited the principal claim owned by Washburs \& Co., and on returning to camp, found much float mineral rock. My companion filed a caveat on these good indies tions, and left that evening for Virginia City, with samples for assay. The next day, solitary and alone, I stroiled around the hill sides, finding more and far richer samples and masses of the same. I broke off with my hatchet some good samplas and pulverized them on a smooth rock. But lo ! the mischievous magnet coveted every particle of sulphoret. Yet I carefully took the whole sample along until I found a little spring and there horned off the light and took new proof that it was iron and sulphur and a lit tle mica which had given it somewhat the appearance of horn silver. The other party gave five dollars for a fire assay which gave no button of any kind.

This new district now centers in the Washburn claim which has an immense chimney of quartz cropping out 40 or 5 feet high and 8 or 10 feet wide. The croppings assay ove thirty dollars. The character of the rock is argentiferous galena. They are about to drift through the ledge about $3($ feet below the surface, and are quite sanguine of a big strike. I hope they may, for they seem worthy of good success.
Galena, if it is not rich enough to smelt, has not hitherto been worked successfully by our wet processes. This is noा one of our problems to solve. Some of the experts say lime added will change the lead to a carbonate of leac (white lead $\mathrm{Pb} 0, \mathrm{CO}^{2}$.). I think I will go out to Reese River this fall.

## REESE RIVER.

The special excitement of the day appears to be Reese River. 'I'he daily reports from this interesting locality are really quite exciting. The rush thither, notwithstanding the near approach of winter, increases rather than diminishes. Not only from Washoe, California and Oregon, but also from Salt Lake, crowds of men women and cbildren are pressing into this new silver land. A late Virginia paper records the fact that the day previous not less than 60 names were booked at that point for Austin, the central point of the Reese River region. Many go there with limited means, in the hope of acquiring fortune by accident rather than by systematic prospectiug or lavor. Good leads, in great abuudance, are no doubt already opened, and many more are to be discovered; but there is little probability, that more than one in ten of those now going will be counted among the lucky ones. It is too distant and expensive a country to prospect in without means, and there is not yet sufficient capital there to open, even to a limited extent, (and thereby create a demand for labor) a tenth of the leads already known.

Let those who contemplate going there defer their trip till next spring. But little can be doue there this fall or winter, and the cost of living in that distant region will be very high, to say nothing about the extreme difficulty that will no doubt attend the procurement of proper shelter, even with an aluudance of means at hand. It is feared that much suffering will be encountered there during the coming winter. Most of their flour comes from Salt Lake, a most precarious base of supplies.

## the miners and mlles.

We do not make these remarks from any lack of confidence in the maines. We have the utmost faith, not only in their richness, but in their extent as well. We are fully satisfied that Reese River will prove fabulously rich in silver, and will soon become second in importance to no mining district on the globe!
There are now recorded and located in the mining districts of Reese River about 1,300 diffe ent mining companies. Nearly half are separate ledges. Mount Hope has about 75 companies; Ravenswood, 85 ; Simpson's Park, 230 ; Big Creek, 250 ; Smokey, 350 ; Summit, 100 ; Santa Lee, 70 ; Grass Valley, 15 ; Uniou, 20 ; Cortes, unknown. Numberless new ledges are being discovered and new towns are springing up as if by magic.
Four mills are now constantly running at Austin a,nd Clifton, and one on Big Creek Cañon, and all crushing rock that pays extraordinarily rich. The value of ground in all these districts has adpanced enormously within the past two months, with decidedly upward tendeucy. These mills have already sent down a number of most unmistakable "indications" in the shape of good "sized "bricks," of high assay. Two othor mills will soon be in operation in that region. Of cuarse these mines are as yet but slightly developed. Most of them hare had only the few days of work done upon them necessary to hold the claim until another year. Others have been stripped along the surface, merely to show the continuity of the ledge, and to get out a few tons of croppings for' a test crushing. A few have been opened a depth of a hundred feet or more, by tunnel or shaft, bat what is of the greatest importance, nearly all that have been tested by practical process, have even exceeded all anticipations, and the bricks that are now being turned out daily, are such tangible evidences of the value of the mines as to convince even the most skeptical.

## capital going thither.

Capital - is fast findıng its way into this region, and not a few men of means are quietly at work buying up clains, some for permanent investment, others for speculative purposes. A large amount of European capital is also seeking employnent there. A degree of confidence has already been established which gives high hope of an early and rapid development of the resources of this new Silver Land.

## telegraphic communication.

True to the instincts of the great American people, the practicability of a telegraph lias already been looked into, and a connecting link with dumboldt and the fest of mankind may be looked for early the onsuing season,
cimate, labor, etc.
six feet. The winters are not excessively cold, however. The summers are pleasant anil agreeable. There is an abundance of grass for stock. Howes and mules are ranched and properly looked after for one dollar per week. They may also be tumed loose, and obtain a very good living, but under such circumstances they are liable to change hands sudden1y. The price of labor at Reese River is about the same as at Virginia City. Persons going thither can go most economically with their own animals. The distance from Sacramento is about 340 miles and can be made on horesback in about twelve days. Those who go there, the present season, should be amily provided with funds. Prospecting will soon be over with until next spring. Thuse who go to speculate in "fect" or to erect mills, will do well to go at once. Great numbers of owners of feet will soon be sadly in need of dollars.

## the mines.

Buel \& Co's Mill appears to be particularly busy, and is turning out large quantities of bullion. In addition to the ore from the Yankee Blade and Uniou No. 2, alluded to in our last, as worked at this mill, the Reveille, of a later date, contains the following:-
On Wedsesday the 2 nd inst., there was shpped from Buell \& Co's mill, 1,030 ounces of bullion, the yield of nine and a half tons of Yankee Blade rock ; and 437 ounces trow three tuns of Union No. 2. This bullion was worth about $\$ 130$ per ounce.
On the 11 th inst. a brick, weighing 200 ounces, was received in Virginia City, the product of a small crushing from the Marhattan Company:
We clip the following items from the Reveille of the 5th
The Austria is selling at $\$ 12$ to $\$ 15$ per foot ; the Zouave at $\$ 15$ to $\$ 20$, and Goluen Era at $\$ 20$ to $\$ 30$.
Ario ledge, near North American, is 150 feet wide on the surface, and ussays $\$ 3,100$ to the ton.
Eclipse rock, 14 feet below the surface, presents numerous Takes of native silver, with other forms of the precious stuff The ledge is three feet wide and rapidly iuproving.
Sada. Redfern is the name of a new discovery, made just above Panl street; ledge three feet wide, and rich. They came on it while digging post holes.
Vineyard ledge, anew discovery, has created much excitement recently. It is three feet wide and quite rich; extensious have been taken indefinitely:
Three pounds of Flora rock worked by hand process yielded over one ounce of pure silver.
We have seen quite a handsome button of silver from five pounds of ruck of the Gen. Meade ledge, a new discorery at Big Creek. It was quite promising indeed. The shaft on the Josephine is down twenty feet, and a tunnel has been run to and through the ledge, which is twenty feet wide, and will work over $\$ 200$ in the mill. Uanon City is still improving in a permanent manner.
Mind Your Quartz-Owners of the Governor Moreton took a spacimen of their waste ruck last week and had it assayed. The result was $\$ 29550$ to the ton in silver. The rock tried was a conglomerate casing of a dirty grey color, appearing for the world like old ashes. Hence we come to the gratifying conchusion that silver maty be found here even in the dirt or mixed cases of ledges as well as in the quartz, so largely; no matter how indifferent it may look.
Sarta Clara.-Considerable attention has been drawn towards mining operations in Santa Clara county. They are raming the second tunnel in the Capitola claini, after having struck the lead in the old tunnul at a depth of fifty-seven feet. Several gentlemen trom Copperopolis have recently visited locality, who represent the Capitola rock to correspond well with that taken from the mines at Copperopolis. The Company is in about sixty-five feet, and the indications are constantly improving. The stock is principally owned in San Jose. The claim is located about eleven miles from San Jose in a south-westerly direction, and oue mile above the Ton Miles House, (Beatty's,) on the south side of Los Gatos creek:
The Profidence Company:-This company's mine is locacated in Nevada county, about two miles below Nevada City, on Deer creek-the third cleaning up, from their mill has been shown us, and consists of a gold bar worth seventeen hundred dollars. No assessments have been levied by this company; their mill and workings have all been paid for by the yield of the mine. Eight stamps are now to be added to their mill, making a total of sixteen. We are pleased to notice the prosperity, of this company; as it proves that we have good mines near home, and shows us what good managesuent can accomplish in quartz mining. We predict a dividend in a short time by this company.

## THE MINING sHARE MAREET.

The Mining Share Market has exhibited no peculiar feer tures doring the week. The depression, heretufore noticed, still continues, although a fair amount of business is reported in leading stocks.
Ophir has been dealt in to the extent of 156 shares at . prices slightly improved from the closing rates of last week. The dabage done to this mine by the recent cave has now been fully repaired, and the main shaft or incline, is the best in the Territory, baving been much improved and eularged. Work upon the rich seam in the lower gallery was re-commenced on the teuth instant. Rich ore is still being extracted from the new vein. None of the rock from this vein has been sent to this city for working, as heretofore reported The Company possesses every facility at their own mills for working anything which comes from the mine. The "cave" has been a fortunate circumstance for the Ophir. By it the Company gained a new and splendid incline, an improvement which the dilapidated condition of the old one would have soon rendered necessary, and in consequeace a new vein was struck, which has more thau paid all expenses, taking into consideratiou both the time lost and the cost of imprever ments.
Gould \& Curry shares have met with an advance of fully $\$ 600$, over last week's sales. This advance is owing to the very satisfactory repurt of the Board of Directors who have recently visited the mine. Most important additions are now being made to this Company's mill, to meel the increasing demand of the mine upon the reduction works, Latest accounts are to the effect that two new boilers had just arrived, each 24 feet in length, and each weighing 7,270 pounds. Three more of the same size and weight are yet to arrive. All thesse boilers will be used to drive the now two-hundred-and-fifty horse power engine soon to be erected to drive the amalgamating aparatus in the company's mamomoth mill. This new machinery will be put up in a new addition to the big mill, which addition will be of the same width as he old mill, and some sevent $y$ feet in length.
Savage shares have fallen off $\$ 300$ since our last quotations, with light transactions. The market clused, however, with decided indications of an early improvement:

Hale \& Norcross have slightly declined with light sales. The mine of this company will soon be in a condition fordoing a good business, apon which a decided improvement in its shares may be expected. They have now a double shaft 300 feet $d$ ep from which they are raising from 30 to 40 tons per day. They will soon be able to raiss a much larger quantity. Two mills are now employed crushing the ore from this mine.
Yellow Jacket shares have been much in favor and readily command $\$ 1,050$. Holders, however, are firm, and do not care to part with their stock.
Daney shares have met with large sales; 510 having changed hauds, at fluctuating prices. .
Burning Moseow fluctuated from $\$ 120$ to $\$ 135$, with a large business, 322 shares having changed hands during the week.
The Mexican Company, since the "cave" has put three new shalts down to the depth of 127 feet at which point they have been compelled to stop on account of water, and will not be able to sink further natil they get their engine in operation. They will go down 250 feet before drifting to the ledge. This shaft is one of the best in the Tervitory, and is divided into three compartments. This Company has but 100 feet of ground, yet they have raised some of the richest ore found in the T'erritory. The Company has no stock in the market, but its shares are valued at a fabulous price.
The stock of the Mexican Company, No. 2, is begining to attract some attention. The company has a shaft of 80 feet which has just cut a five feet ledge. The rock looks promis ing: The shaft makes about 60,000 gallions of water per day, which is kept down with a pump. This stock is quoted at $\$ 35$.
The Belvirder Company has recently sold out its orinal shaft to the Choller Company. Since the sale they have moved east about 100 feet, and sunk another shaft upon anclaimed ground, in which they have struck another vein from which they are now taking ont pay rock.
The Sierra Nevada Company is located upon the south side of Cedar Hill, The works of this Company have been
ipuite ricently commenced, with very flatteriag proipects, add liey have done a very large amount of work for the time in thich they have been enguged. We shall speak inure fully H cheir work, in our next iosue. The stuck of this compuny 10 in goul repute.
Uverman shares which last week ndvanced from \$475 to 600, haqu declined to isti5, with a weak market.
Baltic had linctuated with large trausactions.
Fismeraha shares have been racher more active then usual he luat week
Wide West has met witis a further decline, 230 shares havHy changed bands att from $\$ 11$ to $\$ 8$ º.
Real del Munte has further iuproved and is now quoted at 425.

Silver Hill has slightly improved, with much enquiry.
In I'ond qquite large transuctions are reported at speceulative ates. Opening at $\$ 55$, it suddenly advanced to Sio0. T'ho losing uffers are $\$ 200$ bid and $\$ 250$ asked, without sates. he bears appuar to have it all their own way in this stuck.

## COPPER.

The Atlantic papers, in view of the rapidly increasing hipmeints, uctual and prospective, of copper ore from this to iastern ports, are berimning to discuss the possibility that he receipte may soou exceed the capacity of the smelting jurks. A writer in a Now York paper, however, sets the hatter at rest, by showing, very deffinitely, that the works t Bustou and New York, alune, are quite equal to meet any alls that nay be mude upou them for some time to come. few York, it is argued, should provide such facilities as hould render that priat the center of this growing trafic. Stucks in well developed copper wines are held firmly and fill duubtless soon become as desirable for investment as hose ul' it similar class are in New York, Boston or London. n thooe cities they rank, for reliableness, with bank stocks, hid in the latter a copper mine yielding an average of 8 por ent. ore, fully developed would rate at about $\$ 2,000$ per fot. Should one be found there coming up to the Califoris standard, of first class mines, of about 20 per cent, its falue wonld be reckoned at an almost fabulous price. Capitalots, in this State, are as yet slow to appreciate the value of well develup d and reliable copper mine. One promising bine of copper, cren yet in the infancy of its development, * worth a score of the urdinary gold and silver schemes in he ocean of bubbles now floating on the market.
Napoleon has met with an important advance, opening t $\$ 36$ and closing at $\$ 00$ with $\$ 95$ asked. This ingrove lent is owing to very favorable reports from the mine.
The principle sales of the weok have been made at figures ot made public. A number of our prominent business men ave been the purchasers. At 193 feet the lode is exceedhyly rich; width estimated at 25 feet at that deptis with 5 06 feet of cuncentratel ore. The works are being enlarged pidly ; shipments rising 200 tons per month. Ore is being used from 165 feet in depth. 35 men are at work night Ind day.
Several tons of ore from the Aroyo Seco claim, in Amador ounty, have arrived in this city, the past week-the first hipment from that mine. By the same antival came twenvix tons of ore from the Newton mine.
The Piuneer Company's mine, a shorl distance below Iniontown. El Dorado county, is beginning to attract some ttention. 'This mine, besides giving a high assay of copor, is said to return a very large yield of gold.
A small shipment of ore, the lirst we believe from the hine, was received in this city from the Washington Ledge t Cloverdale, in Sonora County, a few days since. The ore was then from a shaft only six feet from the surface, which romises a still farther and plentiful yield of the same.
Our neighbors in Oregon are becoming quite excited about feet," among which copper feet are taking a prominent poition. The latest reported discovery in that region is on the ohn Day river, and 80 per cent. is claimed for the average f a number of assiys. It is said that $\$ 5$ cost of transporation per ton, will place the ore within reach of steam comaunication with this city.

Our Virginia City Correspondence.-We have made rrangements with an-able correspondent at Virginia City, fid slall commence the publication of his letters in our ext issue.

## Rebae River Currency.-Our Reese River friends are

 auch troubled by reason of a great scarcity of small change o remedy this evil a buinpss firm at Austin purposes to esablish a bauk for the issue of small "promises to pay." Anther firm purposes to stamp suall bars of silver and issue them s curreacy. We think the metalic basis will win.

COPPER AND COAL AT ANTIOCH.
$\mathrm{M}_{\mathrm{r}}$. Ediror :-In response to your suggestion that some difficulty has still to be removed in the combustion of Monte Diablo coal at Antioch, allow me to say that the mode of feeding a furnace with gaseous combustibles mentioned in connection with the Norwegian mode of treating copper sulphurets in my' letter of the 3d inst., can be adapted to any sort of fuel ; and, in what I consider its most perfect form, can be employed even where the greatest heat is required and with a flame of any chemical character desired in metallargy; and this with economy in stoking. A form of grate which has been of much service with coal of similar properties to the Monte Diablo, is that termed the "Step Grate "-deep furnace bars are laid, stair fashion, ie., their flat sides upwards, sufficiently overlapping to prevent the cinders from falling through, and sufficiently raised to admit air where the risers would stand in a stair-case.
I have working drawings of some of these furnaces. A Poor Chemist.
San Francisco, Sept. 17, 1863.
New Mining Office. - Messrs. W. P. Denckla and A. L. Chamberlin have a newly arranged Office, in the commodious store, No. 418 Montgomery Street, for the purpose of transacting a general mining business. Mr. Denckla was. unanimously elected. Vice President of the new Board of Brokers recently organized in this city. We have never measured Mr. Denckla's whiskers, neither the girth of his waist, and we do not know his weight (as the Alta seems to have deterin the case of the worthy President of the old Board of Brokers) yet we thisk Mr. Denckla worthy of the confidence of the mining community. Mr. Chamberlin is a man of gentlemanly and pleasing ways.

Seminarx for Young Ladies.-Miss Butler, late of the Chestnut Street Female Seminary, Philadelphia, is about to open a School for Young Ladies, in this City. Miss Butler is said to possess intellectual attainments of a high order. We bespeak for her a liberal patronage.

State Agricultural Fair.-The State Agricultural Fair at Sacramento, will commence September 25th and end Octaber 2nd. Our thanks are due to I. N. Hoag, the gentlemanly Secretary, for a Complimentary Tịcket.

## WHEELER'S Amalgamating and Separating Pans

It is acknowledged by all who have examined the prin ciples and witnessed the oporation of these Pans, that
they are decidedly superior for triturating and amalgathey are decidedly superior for triturating and amalgamating purposes to any other in use.
The mnst important principle connected with the ope
ratiou of these pans is the separ ratiou of thesc pans is the separation of the trituratiug
process from thr $t$ of extractiog the amalgam from the sand. The chief cause of loss of tbe precious metals arises from the passing off of the same in combination with
the quicksilver, during the proces of trituration, and in the quicksilver, during the proces of trituration, and in
cleaning up By the introuction of the Separating Pan cleaning up By the introuuction of the Separating Pan
to $f$ liow the trituration this loss is entirely avnided. In
working these machines there is no appreclable foss of quicksilver, and hence none of the precious metals.
Where these Pans have been introduced and oporated
by the side of others on sands from the same vat, the by the side of others on rands from the same vat, the
Wheeler Paus bave uniformly gained a large percontage of metals over ite competitors, as woll as a still larger parcentage in the amount of work performed.
*** These Pans man be seen in daily operation, at the Miner's Foundry, on First street in this clty, where al
nterested are invited to call and examine for themselves. 2016-tf

## REMOVAL.

The Office of the Miniva and Scientific Press, has been removed to Ruoms Nos. 5 li and 57 Government House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not only with the view of securing $m$ re room and better accommodations for ourselves, but chiefly to better accommodate persuns having business with the office. Our location is now central, easy of access, and in the direct way of the chief travel of the city to and from the Post Olfice.

## A. Mammoth Project for bupplying Virgina City with Pure

The problem of how best and soonest to supply Virginia city with pore water, is exciting much interest there at this time. The Enterprise gives a lengthy report upon the subject from Engincer Ostrom made to the company, which has undertaken the enterprise, from which we gather the follow ing facts:
It is proposed to collect the water from several small mouutain streams to the northward and westward of Washoe Lake and bring the water so collected into.Virginia. To do this, it is necessasy to convey the same across a valley a distance of six miles, the lowest depression of which is 1200 feet below the required level at which the valley must be crossed to reach Virginia City. To do this one of two methods must be adopted-either to purnp this water up to an elevar fion of 1,200 feet by machinery, or to carry it across the depression in iron pipes. Ordinary cast iron pipes will not stand The pressure; hence boiler iron must be used. The pressure at the great-st depression will be 651 fos to the square inch, which is equivalent to a pressure in a 42 -inch boiler of $23 \overline{5}$ ths. The pipe at this point will have to bo balf an inch thick. But as this pressure will only extend for a quarter of a mile, it is estimated, that an average of one quarter of an inch throughout the entire distance will be ample. This wil make the amount of weight of iron to be used $-32,000$ feet of 15 -inch pipe. half an ingh thick-within a fraction of 630 Hons; which at 15 cents per th will give $\$ 191,700$ as its cost. The entire cost of the work together with service pipe laid hrough the city is estimated at $\$ 497,000$. The supply furnished will be $3,000,000$ gallons per each 24 hours.
The Acid Works.-The Carson Independent announces the starting of the Acid Works in that locality as follows:

The acid works are completed, and have commenced work Everything. works to the satisfaction of the proprietors, and in a few days they will be able to supply the Territory with sulpharie aeid at much less cost than the imported article. Our mill men should encourage all euterprises of the kind, as they go to make up the wealth of the 'Territory.

It is the intention of the proprietors if they meet with proper eucouragement, to enlarge the works so as to manufacture all the chemicles now used in the process of reduciug the precious metals.

## THE GROSCH COMPANY.

This mammoth incubus will not go dowo at the bidding. but still threatens to prove a formidable cluad on the title of
some of the leading mines on the Comstock lode. It would seen as though the lawyers of Califurnia were the busiest and most suhtle of all, created bumans. It is almost if not aposibinty to so perfect a tilie or enact a law that a destined, at an early day to become an important mining loCahifurna lawyer will not reud in shreds by the force of his cality. The specimens which we have received, all present logic or the skill of his cunning. It may be that they are similar characteristics, and are quite unlike any'which oceur one of the necessary evils of the laud, and that we cannot do at any point to the Northward. The chief value of these without them. If we could lave it our own way, however, ores, we presume, consists in silver. Gold, we believe, ocwe would try it for a while, anyhow, and if the experiment proved a failure would endeavor to put up with the infliction with the best grace possible. It is our honest. opinion. that a coumission might be devised, for every mining distrirct, where nine-tenths of all mining disputes night be fairly and equitably settled without the intervention of any other lawyer then the commissioner upon the Bench, who, of course should be a man of probity and standing, especially selected for his wisdom and prudence, and appointed-not electedto hold office during good behavior.

But we have almost lost sight of the item on which we started, the Grosch Company, which has just issued a pamphlet of tweaty pages, setting forth the ground of their clain to three-fourths of $\mathbf{3 , 7 5 0}$ feet on the Comstock ledge. This claim will afford most excellent pickings for the coterie of lawyers who, no doubt were the getters up of the scheme for the simple purpose of levying black mail upon some of our wealthy companies. The companies, however, seem to regard it, apparently with very. little cancern, and declar themselves in possession of evidence that cannot fail to over throw it entirely. The claim covers the following subdivis ions of the Comstock ledge:
Gould \& Curry ... . . . . . . . ... W. . . . . . . . . . . . . . . . . . . 1200 feet.

Forrest Home- Considerable interest is being taken in copper mines at and near Forrest Home, Amador county The "Exchiange Compiny" has' recently been incorporated, and àre now prosecuting the work upon their vein with ener gy. At a depth of thirty feet the vein presents most excel. lent indications, showing a five foot lode interstratified with three distinct viens of sulphar ts, which present unmistakable indications of soon concentrating in a heavy lode. The secretary of this company, Mr. N. King, has left a fine speci men of ore at this oftice, taken from the mine, and weighing some 50 pounds. They have a large quantity of ore already on the surface, and are about preparing the same for shipment. We hope soon to report thes among the ore-shipping mines of that district. The Exchange is located ahout two and a half miles southerly from the Oriental and Cosumne mines.
signature of "C. W. T." were written. This is evidently

## BPECIMENE FROM EL PASO.

We neglected in our last issue, to acknowledge the reception of a box of specimens from El Paso, the new mining district on the road from Los Angeles to Slate Range, the locali. $y$ from whence the letters recently pullished over the similar characteristics, and are quite unlike any which decur curs to some extent, and nearly every specimen in the collection before us presents strong indications of copper. Among the companios represented, we notice the Eureks, Garibaldi, Comet, Tucker, Gov. Downey, Laurel, Gau, Milliken, McClellan, Morning Star, Ben. Lohmond, Manzanillo, Narboe No. Newport, Molino del Rey, Boston, Orizaba, and Maine.
Persons interested or curious in the mines of this region re invited to call and examine these specimens.

A Simple Macuine for Making Ice.-All Paris has recently been rejoicing greatly over a recent discovery for manufacturing ice in a clieap and simple manner, so cheap and simple as to place the entire process within the means of every housekeeper. The machine is described as follows :
"A cylinder of metal-tin will answer-with a movable cover at one end, to be kept tightly in its place by a screw when shut; with two openings' one at each end, to receive throught two funnels the materials used; and a discharge cock at one end, to discharge the contents when the cylinder is to be emptied, is all the apparatus required. This cylinder, when properly charged, is placed on a pair of rockers, so that a see-saw motion may be obtuined. To convert five hundred French grammes of water into ice (each gramme being neffrly seventeen grains avoirdupoise) it is necessary only to place in this cylinder or well twelve hundred grammes of sulphate of soda and eight hundred prammes of hydrochloride or muriatic acid. Into this preparation or bath, says the inventor, place a form or vessel containing the water to be irozen, a bottle of champagne to he frapped, or any other material required to be frozen. Close the cover, screw it fast, and then for seven or eight minutes give the cylinder or well a see-saw motion on its cradle, and you obtain the desired result. A solid block of ice of five hundred grammes may be produced by this operation."
"All Paris, has been running te see the machine at the Rue de l' Arbe, Sec. No. 60, where its effects are pnblickly exhibited. These machings are rapidly sold at from fifty franks to one huudred and twenty, according to the size. A late number of the pictorial paper $L$ ' Illinstration gives a drawiug and a description sufficiently intelligible to enable any of our hretal workers to manufacture them. If we may believe the half of what is said; our dependence for cold drinks will no longer, be upon the icemen, but on the chemists."
Warhoe to be Repregented at the World's Fair-Almarin B, Paul, Bisq., is, collecting a valuable set of specimens, to represent the mineral wealth of Nevada Territory, in the approaching World's Fair at Paris. Mr. Paul has . probably contrihuted more than any ather individual toward the development of that region. He was one of the earliest pioneers in Washoe and has devoted his entire energies, both pecumarily and mentally, towards its develupment. He is deserving of much oredit for his efforts in that direction.

## THE HUNBOLDT MINES

For some reason or other the Humboldt mines appear to be in a a measure lost sight of by newspaper correspondents of late. The Humboldt Register, however, assures us that the mines have xeither "dried up" nor are they deserted. But little prospecting, according to that paper, seems to be going on at the present time, but all the old companies are "plodding quietly along, getting in their assessments as quietly a possible, and puttivg in good solid blows and blasts. This," adds the Régister, "is all right. -t will bring the country out in proper light ultimately, though all looks tedious at at present."

## The Register furher says:

We did hope, that capitalists who put in so liberally for feet would do something in the way of providing means of separating our metals, and thus show the world what these mountains of vire are worth. It would have helped the miners, and would have been a much shorter road for capitalists, to the immense fortunes destined to be worked out of the silver lodes. It would be the shorter road now. Enough is shown to attest beyond cavil the unprecedented richness of the Humboldt mines. But the air line has taken elsewhere the capital that should ere this have built mills for is. Wind work has told for other localities, and we nust wouk patiently on with the few mills we have-trusting to quiel in dustry to es: ablish for us what speculative gas claims all for other sections.
The Register gives full reports of the progress of operations in the several districts, from which it would appear that the miners themselves are not at all discouraged at the present cloud which hangs over that region. We condense :-

Star District.-No accounts save that all the companies of that district axe pushing ahead with their work.
Buena Vista District.-Companies all at work. Cideinnatus, the largest tunnel in that region in 300 feet. Sargent pushing on their tuanel night and day. Buckeye, ditto ; in 110 feet. Anderson in 70 feet, with a well defined and good looking ledge. National \& Downey, Cedar Hill, going ahead.

The "Monitowoc," have pushed their tunnel to the distance of 100 feet. This is one of the most promising ledges in the district. We have assays of rock from this ledge before us, as we write, made in this city, which read as follows:

Average assay of 14 sacks of Monitowoc, $\$ 52535$ to the $t$ of of $2,000 \mathrm{Bbs}$.

Another informs us that $3,300 \mathrm{fbs}$. of rock from this mine woked bv Bradshaw \& Co. of this city yielded at the rate of $\$ 525$ to the ton.
Another assay yielded $\$ 1,41789$ in silver; and still anqther $\$ 32852$ in silver and $\$ 3311$ in gold.

Assays in Unionville have been made as high as $\$ 3,000$.
With such indications we should suppose the company might go on with the greatest confidence in developing their mine.

Sacramento District.-A correspondent of the Register pronounces this one of the richest districts in the region.
The Cosumnes are driving in 2 very extensive tumnel, working night and day. The Howard, Iowa, Mary Stephens, Tehama, Sebastopol and many otber promising claims are included in this district. The correspondent alluded to says:
"The best indications of silver ledges (the black and brown traces) are more fully shown here than in any other district yet discovered. It is remarkable that so few miners or prospectors are neither geologists or mineralogists, but merely visionists; they seem to run astray after the green and blue sulphurets or stains for rich mineral indications-a most fatal error."
Sierra District.-The Sierta District is also thriving. The Oroesus is hauling some very rich rock to the Sheba mill. The result will soon be known. The Natches is still pushing on their tunnel: Empire Tunnel Company is taking out rock, and having it worked at Fall's mill. The Eclipse Tunnel is being pushed on vigorously under Charley Barber's supervision. Tne Neptune Series, Gideon Band Series, Monroe Series and numerous other Oompanies are actively pushing forward the work of development.

Trinity Districte-This is comparalively a ney districtinhospitable, sandy, salty, sagy, full of alkali and good in nothing unless it be mines; in this particular the Trinity follis think they have "gat it." The Evening Star Company are taking out rock, and sacking it to send to Virginia City to be worked-considered rich in both gold and silver The St. Charles Co., Keystone, Tezas, Pennsylvania, etc., are all promising ledges, and located in this district.

## ESMERALDA.

Probably no mining camp east or west of the Sierra Nevada hâs suffered more, proportionally, from-law suits and the general dilitory proceedings of the Courts, than Aurora city. The calender of her District Court has been for some time overflowing with complicated and confused litigation, the result, according to the Times, of judical inertia. The recent boundary survey baving proved that the mines; or at least four-fifths of them are outside of the limits of the State of California and her courts, bas apparently dissolved numerous injuction suites, and, by a sort of tacit common consent, the several companies have agaio resumed work upon their claims. The Pond company have put four shifts of hands to work, Real del Monte and other companies have olso gone to work again, and the camp is assuming quite an unwonted degree of activity. The prages paid to the laborer will enable him to pay bis obligations and the boarding man or merchant will receive his demands in gold, which shows the beneficial effect, active employed labor has upon the whole community, and no branch of trade or business can fail to be effected beneficially thereby.
'I he Times is very properly jubilant over the new condition of things and asserts that the ledges of that district only need to be worked to realize the most sanguine expections. It claims that the Del Monte company, to-day, works as rich a ledge and as lasting as ever poured bullion into the lap of enterpise from any quarter-Virginia, Gold Hill, or any place else. It furthermore says:-
"We have an abundance of rock which pays all the way from fifty to two hundred dollars per ton and upwards; and will they tell us that our mines are of no value? If stecks are down, what of it? Some capitalists have faith sufficient to erect mills of great value among us, and they believe they will be remunerated. Mr. Fogus has just completed his mill. The Real del Monte will before long, have their mill done. I'he Antelope Company is putting up a large mill. To those who would condemn us, we would say, suspend your judgement for a while-let our new mills get under way. Let them add their yield to that of those now running, and after a fair test, if our mines will not pay, give your verdict against them. Till then you should not say ought against us."

## the mines.

The Times notices four good sized "bricks," valued at $\$ 18,363$, the yield of 164 tons of rock from the Aarora ledge, of the Real del Monte Consolidation- $\$ 112$ to the ton, crushed, we presume, at Fogus' mill، That comes up to Comstock, and with sundry yields from other ledges, which we give below, affords pretty good evidence that Esmeralda is very far from being a failure.
The Real del Monte mill, one of the finest and most complete on the Western Slope, will commence ranning about the middle of November, after which time the Company will be able to crush their own rock. They now have a contract for the delivery of 10,000 tons of rock at their mill at the rate of 40 tons per day. It is estimated that the rock last crushed is a fair average of what is to come. A pretty good prospect for one Company. We look for-a rapid increase of Bullion Shipments from this Camp from this time out.
Mr. Fogus has completed his mill; it went into operation on the 9 th inst. The mill has 12 stamps, 8 . Wheeler pans, and 3 separators. The machinery is well arranged. Mr. F. is to crush for the Real del Monte Consolidation.
The Crocket has now fajrly tested their ledge and have proved by practical demonstration that it is valuable. They recently cleaned up $\$ 8,000$ as the result of one week's run After paying all expenses, they were enabled to declare a dividend of $\$ 5$ to the foot. They have a shaft down 180 ft . and are working night and day.
The Seymour Company recently cleaned up $\$ 1,400$ from 10 tons of rock. This Company has also been enabled to declare a dividend. Their shaft is down to the depth of 60 feet. The claim is pronounced valuable.
The Clan Alpine is being worked with two sets of hands. The Company intend to take out at least fifty tons of rock for their next crushing. The rock is thought by the Comprony to be improving. . The deeper they sink the richer it is. That is a fine characteristic.
The Maggy Green Company is situated on Silver Hill, near the Utah. It is reported the Company recently struck very rich rock. The ore resembles the Utah, and is said to

The Clan Alpine has receutly had a crusbing with th most satisfactory results. We expect to hear of anothe crushing soon. Thein ledge improves, as theg go down.
The Poeaset are about having some of their rock crushed They take it to the mill in sacks. The Lady Kate are fino ing good looking rock. It is much decomposed and show well in silver as well als gold.
The Western Summit, we believe, are not doing mucl at the present time. This is an incorporated Company, will its busmess office in this city. The Company bas a cunflict ing clain with Ural, which the Times explains as follows:-
"The Western Summit claim twelve huudred feet; thit Ural four hundred feet, supposed to be the same dode. Now; if the Ural should succeed in maintaining the claym to the four hundred feet, there will yet be left to the Western Sum mit eight hundred feet of the best and richest, or rather ont of the best and richest claims in the : District. We als learn that both mines aro well opened, and can be worke expeditiously.
The Siam is lecated about midway between the base anc summit of "Middle Hill. The Company have incorporater and located their office in this city, The ledge is abou three feet wide, and they are sanguine of opening a rich mine 'The "Kinderhook," another very fine ledge is located il the same vicinity. A shaft is now being sunk on the ledge with very flattering' prospects.
The Magdalena, under the superintendence of Mr. Rober Howland, are very nearly up to their ledge.

The accounts from the Bodie District are very encourag ing; extravagant anticipations are indulged in, the proof 0 which, it is claimed is a mere matter of time.
Tunneling operations, which constitute an important fea ture of this locality are progressing most satisfactorily.

## [From an Occasioual Corrcapondent.]

Silver City, Oak Run District, Shasta County, Sept: 4, 1863.
This new land of silver and gold was unknown in th mineral world until last spring. At that time a few lodes weri discovered on Pitt River ; this led to more exter.sive prospect ing. Ledges were traced for many miles ; a number of min ing districts were formed and minerals were found in gree abundance. But at that time little was known of their val uc. The next step, of courso, was to ascertain, by nssays. something of the character and value of the minerals. I was found that lead exceeded in quantity but that silver es ceeded in value. The highest assay yet known is from th Keyoma ledge ; this. has assayed over $\$ 7,000$ per ton in gold and silver; other ledges have assayed from $\$ 50$ to $\$ 21$ : per ton in silver. Among these may be named the Silve Creek, General Jackbon, North Star, Coon Creek, Suga Pine, Buckhorn and Union, besides many others of estab lished richness. The mines now present a lively appearance Many visitors are now there prospecting, or investing smal amounts, thereby securing to themselves a portion of tha wealth which the labors of others have opened to the world Cabins are being built, which shows that some are intending to winter in the mines. On most of the lodes above mention ed, work is now going on, shafts or tumels commenced an rock is being taken out. Some companies on the best lodes are intending soon to forward quantities of rock to Sar Francisco, calculating on large profits, even after payiny freight and the high price for working rock in that city. Wit] regard to the geograplay of the country, it is very hearil? timbered with pine, fir, oak and cedar, all commingling is dense forest, save where it is too precipitous and rocky fo. timber to grow. Coal of fine quality exists in great abun! dance. Geologically it is like all other mineral countris : the predominating rocks are primary limestone, greywacke slate of yarious kinds, granite, quartz \&cc., and all is uphear. ed from its original horizontal position and stands at a di] of thirty to forty degrees. : The mineral veins or ledges an interstratified with the rocks, are generally well defined ant from four inshes to eighty feet in thichness: The minera veins run N. W. and S. E., and across these, at right an gles with them, are uumerous creeks, some of which havi worn doan 50 to 80 feet apon the different ledges, thus hetv ing done the work of opening the claims, leaving the "pa rock" exposed for immediate work.
C. P .

A Rich Mree.-The Allison Ranch Mining Company, fo a crushing of 24 bours, one day, recently, took out 500 ounce: of gold.

Exiformity in Names of Mininis Coupan res.- That a grvat evil is being inflicted apou ns, as a mining cummanity, in the similarity of names adopted by our incorporated Mining Companies, is patent to every one. No souner is a company incorporated and in successful tide of operation, with its stack holding a value in the market, than the same name is adopted by half a dozen otber companies in some other and perbaps a neighboring district. If this practice is continued it will result iu a perfect buhel of confusion. The practice should be reformed, altogether. As a check to this evil why should not some prospe ous company whose name has thas been "borrowed" serve an injunction amainst
the use of their name? The evil is a growing one and has already arrived at a magnitude which calla for Legrislative interference, if it cannut be otherwise remedied.

THE MINERAL WEALTH OF WASHOE.
In considering the mineral wealth of Washoe, at this present writing, we wish to be understood as confining our remarks to a very small portion of the region known by that name. We wonld include Virginia City, Gold Hill, Silver City', Empire, Ophir and Dayton, embracing a parallelogram say of eight miles in length by two in width. The famous Comstock lead passes through this district, and furnishes the chief, but hy no means the entire amount of the precious metals which is taken therefrom.
Perhaps the most reliable data from which to estimate the yield of this dis'rict, is that recently furnished the Territorial Enterprise by Wells, Fargo \& Co's agent in Virginia City. From that data it appears that the following, expressed in round numbers; passed through that office during the period specified below :

Total amount for the past eighteen months, \$5.466.000.
The rapid and uniform increase of the above amounts, from quarter to quarter; is perhaps the most interesting and sug gestive idea connected therewith. No one at all familliar with the present rapid progress which is being made in the development of the mines in and about Virginia City can for a moment doubt but that the quarterly shipments will continue to gradually improve for many years to come. The game authority has set down the yield of the entire district, under present consideration, for the year 1863 as ollows,
Virginia City,
$.6,000,000$.
Silver City and Gold Hill,
10,000,000.
Empire, Ophir and Dayton,
$1,000,000$
$\$ 25,000,000$.
For manifest reasons; which must fully appear in the actual returns of the two quarters of the present year already passed, we have added $\$ 1,000,000$ to the estimate for Virginia City, making the total estimated yield of 1863 foot up Twenty-five millions of dollars-a pretty-good yield for a section of country embracing not more than thirty-six square miles. The next year will doubtless largely increase the amount.
The best evidence of the correctness of this estimate is the value at which the leading clains are held in this district. We append a list of the claims on the Comstock lead commencing with the Ophir and ranning south and including the Yellow Jacket, with the number of feet in each claim, and the market yalue of the same.

11,213
1,000
$1,200,000$
$2 \overline{3,470,000}$
The above Companies from No. 1 to No. 21, are Incorporated, with the exception of No.16. From No. 22 to No. 42 , the ground is-all held in private hands with the exception of No. 34 which is associated with 21.
Numbers 16:to 43 inclusive comprises what is known as the Gold Hill portion of the Comstock Ledge. The total number of feet included in the above clains is 11,213 , which, at present' actual selling rates canot be valued, in the aggregate, at less than $\$ 24,000,000$, or an average of a little over $\$ 2,000$ per foot. This estimate includes only those claims which are located directly upon the Comstock lead.
There ? are known to be numerous parallel leads in close proximity to the Comstock and more or less continuous, throughout aluost its entire extent, all of which are more or less paluable, and in sone of which tho stock is held at from one or two hundred, to one thousind dollars per foot. To the - north of the Ophir is Cedar Bill, which holds an immense store of metal, the yalue of which is daily becoming more and more apparent. Far up end all along the Ciastern Slope of Mount Devidson, are leads, many of which are already assuming quite a prominence in the market. To the south of Gold Hill and the claims we have enumerated in that district, and down through Silver City, are atill other numerous claims lqeated within the sixteen miles sqnare to which we are confining our remarks,
In all of these values we have taken no account of the city itself, with its numerous blocks of buildings and real estate, its -immense stocks of merchandise, etc. We have moreover based our estimates at actual cost values in gold, where common labor is worth from $\$ 4$ to $\$ 5$ per day, and where mones is worth from 2 to 4 per cent. per month, on good security.

As a further evidence of the richness of a portion of this ground, it is stated on good authority that the little strip of 468 feet between Nos. 20 and 35, has yielded not less than $\$ 6,000,000$, within the last three years-some portions of it having yielded $\$ 3,500$ per foot in a single month! Five feet changed hands in No. 26, within a year, at $\$ 10,000$ per foot. Some of the owners in this strip of 468 feet have made and spent a fortune in a month; others hare pocketed and invested from $\$ 10,000$ to $\$ 20,000$ per month, clear of expenses. When people talked of $\$ 4,000$ and $\$ 5,000$ per foot in the early days of Washoe, they were set down as lunatics. Now the solid bars that are turned out every week, are pointed at, as indicative of the wisdom of the whilom vissionaries, while the croakers of those days are now nearly crazy with vexation at their former faichlessness in the value of these mines !
Of the total number of 11,213 feet enumerated in the Comstock ledge, only about 4,000 have as yet been developed into dividend paying grounds; some two or three thousand feet more will probably be added to the dividend paying list inside of six months, and from 9,000 to 10,000 feet of this ground will be dividend paying withis about one year from the present time; which developents will add very many millions to the value of the ground, and corresponding millions to the annual shipments from the district.
The developments in Reese River within the past six months, have fully equaled if not exceeded anything which was ever witnessed in Washoe, and there is good reason for believing that three years will do fuily as much for that country as the same time has clone for Washoe! The ball is in motion and now moves on by its own impetus. The probable result, figure it how we may from reliable dota, is absolutely astounding.

Only a few nonths since, in common with most of our cotemporaries, we joined in deprecating the Report of the Secretary of the Interior in his estimates of the probable future yield of the mines of the Eastern Slope; but the results of the past few months have put altogether a new face upon the mitter, and we are forced to acknowledge that the Hon. Secretary, is not so rery bad at guessing, after all.

With all this prospective wealth, however, it should not he forgotten, that mining, even in the limited and immensely rich territory to which we have confined these remarks, is
zes. Taking the district ass a whule, including outside cloim s hundreds will anass fortunes by jadicious irvestments while thousands will luse by reckless ones.

The Boundary Question.-The Boundary Commissioners' now runing the liue between California and Nevada 'I'erritory have progressed so far with their work as to determine that Aurora City, lies about four miles to the eastward of the Califuruia line, white Honey Lake Valley, which had been pretty much given up to Nevada Territory, is found to be within the State of California. Cali ornia will be a gainer in territory, but a loser in population by the adjustment; but a question of much vexation and inconvenience will be dififnitely settled.
Silfer in Idahoe,-Rumour says that silver bearing lodes have been discorered in Idahoe Tertitory. A Sau Francisco company was incorporated in this city on Monday last to work one of these mines.

## THE MINING SEARE MARKET.

The Mining S! are Market still continnes quiet. The chief excitement of the weck has been the defaults of certain speeulators who bave faild to come to time on some of their engagements. The market has been well tested, during the past week, some of its leading shares which were well sub tained, though frcely, offerod.
Ophir has been largely dealt in, 900 share having changed hands at from $\$ 1,995 @ \$ 2,125$, closing at $\$ 2,000$ firm. The dividends of this company will not be increased until after their new works are fully completed. A decided iouprovement in this stock may be looked for after that time.
Since the "cave" three or four bundred tons of ore hase been taken out from an old pillar in the soath part of the Mexican mine. 'I'his pays about $\$ 200$ per ton. During the past four years the ore taken out of this mine came from the southern portion of it. and at the time the accident occurred this portion had been pretty much worked out. As soon as their new shaft is completed they will drift to the nortb.m portion of the mine and work exclusively in that. There is no stock of this mise in the market.
Gould \& Curty has been hut little deal in during the week. A dividend of $\$ 150$ per foot was declared on Saturday, payable to-morrow. It is understood that the Directors might have declared $\$ 175$, still leaving a heavy balance for October, but the majority ruled otherwise. The total asssments from the start have been but $\$ 150$ per foot; the yield of the mine having furnished the balance of the heavy sum of fully $\$ 700,000$, which their mill and miaing improvements have cost. The company has determined to still further increase the working capacity of the mill which they can now do without any interference with their usual dividend. The monthly yield of this mine alone, at the present time, is not far from $\$ 400,000$, while its monthly dividends are about 3 per cont. on its present market value of $\$ 5,000$ per foot.

Potosi Shares are much in favor, with but few offers. It 3 readily taken at $\$ 1.150$.
Savage is quiet at present. Chollar, ditto.
Best and Belcher are not much offered, and closed at $\$ 825$, although an assessment of $\$ 100$ per foot was levied on the 24th instant.
Hale \& Norcross has not been enquired after. The mine works of this company will soon be equal to the best in the 'Ierritory.
Mexican No 2, which we suppose to be the same as that quoted "Spanish No 2," has met with considerable favor, and is quoted at a large advance.
This Company, we understand has strack very rich rock, Sales have been made the past week from $\$ 37$ @ $\$ 60$. It is confidently expected this stock will still further and matoially advance.

## COPPER.

The copper trade is already beginning to assume considerable commercial importance. The shipments from the mines at the present time, are estimated at fully 1,000 tons per month, which will produce rery nearly 200 tons of pure copper, worth about $\$ 125,000$. By the opening of another spring, this amount will probably be trebled. A large number of promisivg mines are now commencing to ship, whose ca-

## raciti"y for raising ore witl be inereased several hundred fold <br> fithin the coming oix montho.

T The present rate of shiphushts does n t fairly represent the quantity of ore being raised. however. from the fuct that onay mines are dectiving to sell at the prices now offering areferring to buld ou to their ores until spring. Mureuver s largiv portion of the ore new being raised, must remain at the enouth of the mines until somo mode of concentrating he same hate been adopted. The machinery now in process ,f erectivn by the Mesors. Pownings, at Copperopolis, will, probably, soon begin to add largely to the production of ship lying ore from that loculity.
Buyers ratos for cupper ores, deliverable either in this city for at Antioch, are at present as follows, puyments made in gold :- 82 per one per cent. for ore yielling 8 to 12 percent.; 8225 , from 12 to 14 per cent.; 8250 for 16 per cent., and $\$ 3$ for '20 per cent. and upwards.

Copper mines do nut appear to be suffering from the genral depression so prevalent in other miniug stocks. Although but little of this cluss of ore is offered at our Stock Hoards, we are advised that there is consicerable enquiry for this class of investment throughout the State, mid much capital will soon be absurbed in this growing interest. The permanency of copper mines and their superior reliubility, over other mining stocks, for investment, is begiuning to bo fully appreciated.

More copper discoveries are reported in the vicinity of Ione City, Imalur cuunty. These discoveries are supposed the be on the range of the famous Newton mine.
The llome Ledige, Fl Durado county, liss made its sceond shipment during the past week, 144 sacks. It comes to this city.
Several hundred tons of ore were received from the Na poleon by the Stuckton buat on Monday last. A letter from fone of the proprieters of the Oriental assures us that that company is now taking out ore in considerable quantity, and that their first shipment will soon be made

Another extensive copper ledge bas been discovered by prospectors from Marysville, in the vicinity of Brady's Ranch. The croppings are said to be rich and extensive. There ia less excitement, now, concerning the Yuba copper lodes, but there is also more coufidence and iodustry in developing them.

The Nevada Transcript of the 23 d inst. says :-"Several companies, in the copper region in the lower part of the county, have struck fine leads. Among them are the General Hooker, Wild Irish snd Copperhead. Several promivent copper men from San Francisco and Copperopolis have visited these mines within the past two weeks and pronounced them as rich as any in the State-Copperopulis not excepted. The owners of the above companies are pushing their shafts ahead and we shall soon expect to hear of heavy shipments of copper ore from this region."

The Mountain Messenger speaks very encouragingly with regard to the "copper fiplds" in the vicinity of Gibsonville isierra county. The Eagle Company is spoken of as having a ledge of concentrated mineral five or six inches thick at a depth of 50 feet. The Newark ledge "contains a bronze like deposit of native copper, disseminated through the rock in delicate sheets and fine particles. Ounce nuggets of pure copper have been repeatedly found in the hydraulic diggings crossed by this ledge." Native copper has been found in al the tunnels crossing the course of the Slate Creek ledge at Mt. Pleasant, but none of them have been run low enough to strike the solid ledge.

The Isabella lode, in Sierra county, is attracting considerable attention. The ore from this mine yields largely in sil ver. It is thought that the silver it contains will pay the entire expense of working the vein. Moderate sums are offered for shares, but no sellers are found. Work upion all the ledges in the neighborhood of Round Tent, Nevada county, and Empire Ranch, are being vigorously prosecnted. Th Burra Burra and Rock Creek Consolidated Company bave a well timbered shait down fifty feet, with encouraging pros pects.

The work of development on the Mount Diablo Copper Minea is still progressing, with improving prospects. Th Mechanic's claim has a tunnel in 60 feet, most of the dis tance in lard rock; 17 feet more will strike the vein. The Keokuck have a tunnel in 65 feet. This company find three
the three are coming together. There are ceveral other good clams in this vicunty. Tho Mount Zion is senerally cunsidered at the head of the list. The tirvat Impublic has a mammoth 17 feet lead, whict prospects well in silver as well Sau Muors, Copper Aye, Romelia and many other companies are located in this vicinity.

## ESMERALDA STOCK LIST.

Tre Value of an Assat-a Caution.A gentleman last week was on the point of concluding a large sale of copper on the basis of a 10 per cent. yield-which was the estimate of a large house who proposed to buy. In time, however, to avert loss, he was induiced to have an assay made.

The mean of three assays made to his order "by "Mr. J. H. Churehill of this city, amounted to 20.31 per cent. of metal. A buyer was found who accepted this estimate; the seller finding the cost of an assay a very smatl item in his savings.

The Humboldt Register publishes the following rather heavy item :-
We see that a company has incorporated in San Francisco with an extravagant capital stock. It is the 'Humboldt Peak' G. \& S. M. Co.-Capital stock $\$ 3,960,000$, in 3,960 shares of $\$ 1000$ each. 'Irustees, Robert Beck L. B. Harris, L. Gors, J.. M. Frey and G: W. Stewart. ${ }^{2}$ Don't know whether they reserved in trust deed the right to increase capital stock ; but that already napmed oughit almọst to build a railroad to California.

The prevailing idea that lightning always strikes the tallest of a group of objects, wás disproved at Woonsockt, Mass., when a cottage entirely surrounded by higher buildings and trees received the whole of a stroke.

An English Minié bullet and Spring field rifle-ball met in the air during' the-siege of Vicksiburg, were welded by the impact, and fell harmless to the ground. They are now firm friends, aticking each to the other closer than a brother or a lover.

A Nev Paper Mill is to be arected by the side of the one alreally in operation on the sau Lurenzo kiver, which is to furnish printing paper. The one now in operation manufactures wrupping paper only, and is said to be a very protitable investuent.

Tue Powder Mill, in the same lucality, will soon be in operation. Most of the wachinery is already on the ground.
It is estimated, says the I'ajaro Times of the 19 th inst., that, within the last year, there has been invested. by Santa Cruz and San Francisco capitalists, in mauffucturing enterprises, on the San Lorenzo River, ut loast five hundred thousand dollars, These investments are returning fortunes. It is ssid that John Sinie, of San Francisco, has about one hundred thousand dollars in the Powder and Paper Mills.

The Ofposition Steayer, Moses Taylor, will sail promptly as per advertisement in another column. The announcement that she would be hauled off and placed tempurarily in the Mexican trade was without any fuundation whatever.

Tue discovery of extensive lead mines in Missouri is now an established fact. In Franklin and Washington cousties the deposits are very rich, and working-men are already earning twenty-five dollars per day in its extraction. Large bodies of the laud can be bought for from five to ten dollars per acre, and it is estimated that one acre will yield four thousand dullars worth of-lead.

## REMOVAL.

The Ofice of the Mrining and Scibntific Press, has been remored to Ruoms Nos. 56 and 57 Government IIouse, corher of Washington and Sansome Streets. We have been nduced to make this change of location, not ouly with the fiew of securing m.re room and better accommodations for lourselves, but chiefly to better accommodate persuns haviug business with the office. Our location is now central, easy pf access, and in the direct way of the chief travel of the fity to and from the Post Office.

## TEMPERING STEEL.

The state of combinations between iron an carbon, which appears to be essential to form steel of the best quality, is, is is well known, destroyed by heat, so far as to entirely imbair itg most important qualities. In tempering steel, the fifect prodaced by plunging the heated metal into cold water, 5 a sudden coatraction of its bulk. The particles of steel re suddenly $d$ riven together, as if by concussion, presenting very close analogy to the effect produced by hammering. $t$ is the character of this concussion that determines the bombinations of iron and carbon which results in the formalion of steel. The heating of the metal not only expands it, put also gives to its particles a certain mobility, which enales them so to manage themselves, that by the sudden conussion which takes place in cooling, the peculiar combinahon necessary to the formation of steel is affected.
If a bar of iron is heated to a bright red heat, and hammerd on an anvil, covered with finely-powdered charcoal, until thas cooled down to a dull red heat, and then planged into fold water, it will be converted into steel at the surface. $A$ bar of iron leated to a bright red and cooled to a dull red p powdered charcoal, without being hammered, will not preent any signs of steel, when plunged into cold water like he bar previously hammered.
Take untempered steel and disolve it in acid and there re. tains a black substance, resembling graphite, which is insolble. When tempered steel is thus disolved the insoluble esidue is not more than one eighth that of the untempered. $t$ uppears, therefore, that tempering produces a true chemical change in steel. Steel formed by hammering, leaves a puch larger percentage of insoluble reaidue than that formed y tempering in the usual way.
Hence it is inferred that the combination produced by lammering is not so complete as that produced by tempering, pecause it produces a concussion of the particles of steel in ne direction ouly-in the direction of the blow-while the ladden cooling by water causes a concussion of the particles a every dirction at the same instant.
In tempering, the more sudden the cooling, the greater is the force by which the particles are driven together, and the ardness and other characteristics conmunicated to steel in mpering, are in an increased proportion to the time of cool-

## [From our ${ }^{\text {spectal }}$ Correspoudent.]

Editor of the Mining \& Scifntific Prass:- It will be unnecessary, I suppose, to give au account of my trip to Stockton per steamer, for beyond the clear, soft blue sky brilliant moon, and balmy nights of California's summer season, it possessed no unusual interest. It would be improper, however, to omit an acknowledgement of the usual courtesies, which the Steam Co, extend to the Press us on these occassions, and we beg to return onr thanks for the attentions so liberally bestowed upon us.

## the faik.

The first day of the Fair, never amounts to much anywhere, being chiefly confined to a suitab'e arrangement of articles for exhibition in the pavilion, and to racing. With reference to the latter, the people of this distriet may be satisfied; for, I understand the horses, running and trotting, made better time, than any previcus year. Dr. Holden, with cordial politeness, presented myself and friend Bromall, with complinuen tary tickets, bidding us use them well and freely, wherever we desired to go, and for whatever we wished to see. The stock exhibition, the races, and millitary reviews, I could not visit, being prevented by attention to my special mission. They were all admirable, however, and passed off brilliantly, with one exception, when by the use of an old gun, totally unfit for service, a soldier had his arm blown away, a little below the elbow. His recovery is doubtful.
tele mining department.
In conformity with my instructions, I paid particular attention to the "Mining and Mechanical Departments;" but dotted down some general observations, of such articles of local produce and manufacture, as I thought possessed sufficient importance to be generally interesting. In neither of the first cases was the exhibition large, although good. Fine samples of ore were on exhibition from various mining localties. Two large blocks of Copper ore were especially noticeable, from the Napoleon and Keystone leads; but as I shall have to speak of these wonderful mines when I get to Cupperopolis. I shall say no more at present, than that their samples for size and quality were magnificent. There were splendid samples from distant mines, Washoe, Reese River, and New Mexico, of silver and copper, which I pass over, as not coming legitimately under obserration. The Great Republic and Hall claims, Monte Diablo, had good specimens present, calculated to raise the copper interest of that section. Lalla. Kedolka, or some such name, 'Toulumne county, had good samples. The Colton claim, Hawkeye district, Calevaras county, very good. Gopher district, same county, the same. Copper Hill Company and Lone Star, both copper, located at Campo Seco, had very superior samples. The Antelope Company; Calevaras county, silver, had a splendid piece of rock. The Dead Set, Col. Warren, Beach How and Confidence leads, were simply marked Mariposa; their sample were good in general. The Cirele of Light claim, exhibited croppings of silver ores from Plata Verdi, the best I have seen in the State; while the Chancellor Pettigrew, the only gold specimen I saw on the table, Sonora, Touloma: county, bordered upon the magnificent. There were other ones of greater and less value exhibited, from different coun-
ties, which I have no time nor space to notice; and in conclading this portion of iny letter, I would observe, that many of the labels were incomprehensible, a fault very much to be regreted as it causes unnecessary confusion and trouble. Those exhibiting articles of valne and general use, should be more explicit in their discriptions.

> tee mechanical departmint.

As I have already stated, the Mechanical Department was not large, but the articles were superior, I shall uotice only a few of the most prominent. The first was a large and magnificent hearse, by Hoffman and Brendt of this city, made to order for the coroner and valued at $\$ 1,600$. It is really a gorgeous price of manufucture; hut whether it will benefit those whom it carries to their last home, I know not. There is nothing of the kind equal to it, however, in the State. In these days when we pay so much attention to the dead, and so little to the sufferings of the liviug, I suppose it is all right.
Mr. J. Pierce of Stockton, had a magnificent set of draw-ing-room furnature, that would do credit th the Occidental. Nash \& Fogg had a case of gentlemen's boots, worthy the dandies of Paris, London and New York. "Webster Bros. had a most ingenious corn-sheller, which will be of great use to this State. The machine I thought most of, for its convenient size and great power, was the Union Plantation Mill, for grinding corn, on Baker and Hamiltons's stand, but manufactured in Philadelphia. It makes excellent flour, and needs only the labor of one man; they had also an air-churn which makes butter in three minutes-only think of that. Mr. Miller, of this city, offered two splendid wagons, for siugle and double spans, which for lightness and strength, were mach admired. There were any amount of washing machines, which appeared to attract the ladies; but on listening, I found their opinions varied so much that I prudently abstain saying anything about the partienlar merits of either. Dr. Debrom of this city, had a most beautiful glass machine, showing the circulation of the bleod through the system. It is beautiful, meritorious and instructive.
I am sory I bave not time to notice the many other useful exhibitions present; but I cannot omit saying, that if Stockton does not go much ahead in buildings and improvements, her cilizens are alive to their interest, and present articles of home manufacture, which would do credit to any State in the Uuion. J. D. P, Walker, had troo sets of harness: one buggy and one wagon, which in material and workmanship would vie with the celebrated Consend harness.
The other cities of prominency were all represented.Bowen \& Co., of San Francisco, had a magnificent ussortment of family groceries of every discription. The Messrs. Taylor of Sacramento street, sent up some of their own paper, which is spoken of in the highest terms. A Mr. Jno. Burns, had some horse-shoes, and racing plates which for finish and designs, 1 never saw surpassed in England. Jacobin, of the Pioneer Distillery, Marysville, had a jar of turpentine, and glass resin, made in their establishment, which all ágree, cainnot be beaten by any country. Provost of San Jose, had a magnificent display of silk-worms, which were very interesting as they we:e busy at work spinning. I have long advocated
the cultivation of the nulberry tree, instead of the grape-vnie, for a product of value, and a means of industry there is no comparison between the two, so far as the best interest of the State is concerned. There was any amou $t$ of California wines exhibited, but I don't think much of that branch of our revenue.
FRUIT EXHIBITION.
Although this section of country has been slow in cultivating good fruit, they have succeeded at last. A more magnificent display was never presented to public inspection. Mr . Bensón, from Mokelumne river; had ten apples which I measured, und found they averaged 15 inches round. I took the length of a bunch of six carrots, and found them all nearly three feet long. The Mormon Slough Garden, gave grapes weighing five pounds and upwards per bunch, while the beiry was as large as those of France. There was one bunch, from a Frenchman, more splendid than any I ever saw in France. Squash, beets, cabbages, etc.-were ever such monsters seen? One pear, out of hundreds, of the Datchess D'Angolome tribe, weighing 33 ouncers-did'nt ones teeth feel funny. tribe, weighing 33 ouncers-dir'nt ones teeth feel funns.
There as a bag of sweet Lisbon onions, grown by Mr. Murray, which he says are infinately, better than any he ever grew in the richest soil of Ireland. They were xeally magnificent. Mrs. Dr. Beatman had a sample of home-made raisins, one year old, and others of dried-apples, pears, peacles, plums, not to be surpassed in any respect. You must understand, that I have only culled these particular specimens from a host of the highest order, and which I do not mention, simply because I have not time. I can only add, in this connection, that San Joaquin is entering on a bright desting.

## fancy articles.

The ladies' handi-craft formed a conspicuous feature this year: I could not spend the time I desired in examining its many treasures of tastes and skill. Mrs. So-and-so and Miss Something-else, had so many articles of costly beauty and magnificence, that I concluded it would be too dangerous to mention any particularly. I cannot omit, however, even at the risk of having my head taken off, mentioning a blue dress-coat, with gold embroidery by Mrs. Melender. It certainly, for gorgeousness and accuracy, beats all of the kind I ever saw; not accepting the official coat of His Royal Highness, the late Duke of Sussex, while at the head of the Masonic order in England; for, though not so varied in color, it -was equally grand and elaborate in execution, Babies' caps, dresses, bed-covers, and a thousand things, mysterious to us bachelors, laid in profusion before me, and all I think it safe to add, on this branch of industrial skill and energy, is: God bless the little fingers making them; may they never weary in their own duties of life, for it is far better to be thus employed, than manufacturing bloomers and writing politics.
I acknowledge this is but an imperfect discription, but copious enough, I trust, to be satisfactory to my old friends in Stockton, who have treated me so kindly on niy re-appearance amonget them, and interesting to your numerous readers; whose indulgence $I$ crave on this occasion. The post is closing, and $I$ have to prepare for the ball to-night. . The lady I take polkas easily at 2-30, which is fast time, and the thermometer stands somewhere about ${ }^{\circ} 90$-if I survive you shall hear from me next week.
L. Harnett.

Our Wells.-A correspondent writing from Titusville, Pa., furnishes the following in reference to the oil regions in that State: Almost as old as the hills surrounding it are the springs which once gave it the name of Oil Creek, and now makes its fame world-wide. There is but one king here, and all are subjects. The head and front, the root and branch, of every species of business, in its legitimate callings-as speculation in its most rampant form-is Oil ; consequently you see, in close proximity on every side, oil depots, oil refineries, oil derricks, oil tanks, oil shippers, and the everlasting inevitable oil team-at once a nuisance and a necessity, as you may judge when two thousand of them have passed over a given point or bridge, where a market was kept, in one afternoon, cutting up the roads in a frightful manner, and reducing them to such a state that, between mudholes, stones and stumps, you may well suppose that pleasure riders are not the order of the day. For bustling activity and teeming population we resemble Western towns; while dreams of wealth, wilder and more fabulous than the Arabian Nights bave heen realized in a daya What do you think of "the big well," which flows two thousand barrels a day, bringing its owners an income of two dollars a minute, and supplying
one-third of all the oil sold here. There has been a million of dollars paid by its owners for this well-one small share having been sold for $\$ 15,000$ These are only a few facts of the many, of the wealth accruing privately and collectively to individuals. The well owned by Dalvell Brothers, brings them eight huddred dollars per day. The revenue which accrues to the Governmrnt, is five millions a year. What has the South to offer equal in resource to our oil wells?

## $\left.\begin{array}{r}\text { El Paso Crty, Los Angeles Co., } \\ \text { Aug. 27, 1863. }\end{array}\right\}$

Ed. Press:-It is a very dull time with us; hot weather but little emigration. I suppose all are waiting to cast their votes before starting out.
I have been at Ophir City for some days past helping the Tappan Oompany to open thelr tunnel to the Ohio lead. They are progressing finely. While absent a circumstance of considerable interest has transpired: No less than the advent of a live white woman, the first ever seen in this district, who has' accompanied her husband; Mr. Boyd, with a loaded ox team, to Slate Range, on a pleasure trip, I suppose. They passed through our city yesterday, and will probably return in about ten days.
31st. at Ophir City. For three days we have had terific thunder and lightning storms, accompanied with rains, lasting ahout an hour or more, breaking through our tents in all direction, and washing everything inside, upon the ground, making our situation very uncomfortable. The sun, however, comes out warm a part of the day, so we shall soon be all right again.
Messrs. Milliken \& Warner have just completed a good board house, (the first in Ophir City,) and outsiders have had the priviledge of sleeping there while their camp floors were drying.

Sep. 2. A team just arrived from Los Angeles, with supplies for all hands, and news up to the 25 th ult.
I heard that Geo. Merrick, the young' man who was wounded by his own pistol, while riding on horseback, has had his leg amputated; was very low, not expected to live. Charles Nesbitt, who was so serverely wounded in a tunnel here, Aug. 14, was doing well and able to be out.
7riz. The team started back to-day and took 14 more specimens of ore croppings for your cabinet, and some for
But little prospecting is done here now, yet as many as six new and promising leads have been located within ten days. The work of tumeling is going on without interruption, and in a few weeks we hope to be able to send up some rich ore for reduction.
The Live Oak Gold and Silver Mining Company have just got their deed of trust signed, preparatory to incorporating. And intend going to work on their claims, La Platas 1, 2 and 3, and the America, right away.
The Gila, (pronounced hee-lah,) River excitement has had a tendency to direct the tide of emigration'from us to a great extend, and may seriously retard our growth. We hope that the hard working men will come here, as this is far enough from civilization, though only half as far as the new diggings.
9th. In Press, No 39, we notice a reference to a new drilling machine, invented by Mr. J. S. French of Bangor; Maine, and I earnestly wish that something of the kind could be introduced here, where tunneling is the main business of all.
Could you not influence some clever man who has a firstrate article in that line, to send us out ove as a sample, by which we can order more if they are successful. I would take all the responsibilizy required in the arrangement, and our mines would throw some of their feet in the market, al a very low figure, to procure a machine, which would take the place of handwork.
C. W. T.

How to Administer Castor Oil to Children.-The Medical fraternity of Paris recommend the following way of administering castor oil to children :

The quantity of oil prescribed is poured into a small earthern pan, over a moderate fire, an egg broken into it and stirred up so as to form somthing like what cooks call but tered eggs; when it is done, a little salt or sugar, or a few
drops of orange water, or some currant jelly should be added. The sick child will eat it eagerly and never discover the fraud.

A single firm pays one hundred and fifty thousand dollars year to the London Limes for advertising.

## MATERIAL FOR WINE CASES.

A correspondent of the Alta, furnishes, in substance, the following to that paper:-A question of no little importance to the wine-growers of this State is that of casks to hold the wine. 'Hitherto pipes used in importing liquors have been employed, but experience has proved them in many ways unsuitable, to say nothing of the fact that the supply will soon become totally insufficient for the demands. The ordinary material for wine-casks is oak, but the oak of California is too brittle for any such purpose, and new casks, made here of imported oak, cost about 20 cents per callon, The winegrowers of the State were in a serious difficulty; they thought of sending to Manchuria for stave timber. Fortunately they are now under no necessity of going so far. It has been discovered that the redwood of Colliformia will serve the purpose; and for this important discovery the winegrowers are indebted to Col. Harazthy. The redwood is a tree peculiar to the coast of this State;-it is not found in any other part of the world. The tree is, next to the mammoth trees the largest species of the vegetable kingdom, growing to be 300 feet high and 20 feet in diameter. The wood is
straight in grain, and it splits very fieely; and it is thug pole straight in grain, and it splits very fieely; and it is thus p culiarly fitted for stave timber. But the wine growers wre a fraid of it because it has a strong red color, and a very astringent juice, as is shown by the black color which it assumes whenever iron touches it in a moist place. Both the color and flavor of wine therefore were in danger from it. Col. Harazthy tried to draw out all solnble culor and flavor by steaming, and he succeeded; and the wood was thus rendered fit for wine casks. He steams the staves for sixteen hours. He says that he has proved the fitness of redwood thus prepared by a trial of four years.

Important alleged Medical Discovery,-Among the latest reports of the principal hospital of Paris, is an account of a discovery of great importance. It appears that a young student enunciated the theory that gangrene or mortification was caused by a deficiency of oxygen in the part affected, and advanced so many plausible reasons in support of his views, that the surgeon in chief to the institution, who happened at the time to have a case of gangrene under nis care, determined to give the hypothesis a fair trial. The patient was over seventy years of age, and his foot, in which the disease was making rapid progress, was about to be amputated. The mortified part was enclosed in an apparatus so contrived as to yield a continous supply of oxygen, and the result was that the gangrene was arrested and the foot saved. The experiment was repeated in the case of another patient equally aged, and with the same success. The inference is that oxygen thus aplied, is the specific for a disease which is the scourge of all hospitals for the treatment of surgical cases, Since the present war commenced, probably many hundreds of our soldiers have died of gangrened wounds, and if the ap-
plication of so simple and agent as oxygen gas will stop the plication of so simple zud agent as oxygen gas will stop the progress of decomposition in living flesh, by all means let the French mode of treatment be adopted in all our military hospitals.

Ancibnt System of Telfgraphing.-At the Royal Institute, Professor Thomson lately drew attention to an ingenious system of signalling invented by Eneas Tacticus, 300 B . C., and described by Polybius. Two earthern vessels of the
sane form and size were filled with water, and provided with a stopcock. One was kept at head-quarters, and a scout carried with him the other. Down the sides of each were placed short sentences, such as "eneiny moving off," "enemy coming," "enemy gone," \&c. . The scout, when he found out what he wanted, keeping himself all the while in sight of head-quarters of his own genera?, was to wave a flag or a light torch, and simultaneously allow the tap of the vessel with him to be turned to allow the water to run oat. The tap of the vessel at head-quarters was also to be turned on, When the water had sunk to the sentence he wished to communicate, the scout would wave his flag or light his torch the second time, and by immediately turning the tap of the vessel in camp, the general would see where the level of the water then was, and correspondingly the sentence affixed, by which cantrivance be would receive information some hours before the scout could personally communicate it.

An American Tea.-We have heretofore alluded to a shrub which has recently been brought into notice in Pennsylvania as a substitute for tea, of China growth. We find the following additional paragraph in relation to this article:-
An excellent substitue for tea grows in large quantities in Tioga county, Pennsylvania. It is said to resemble Chinese tea so much that merchants bry it to mix with the genuine. In Clinton connty, Pennsylvania, the genuine article is clumed to grow in abundance, and the citizens thereabout are jubilant at the prospect of becoming independent of the "pig-tails." One gentleman, who owns a farm on which the herb is indigenous, says that his attention was first called to it by a native Chinese, who declaired it to be the genuine Ohina terplant. The gentleman uses it on his table, and no one suspects it as not being the imported article.

on my patcot, und a snit is now pending la the U. Sir-

## VENTILATION OF MINING TUNNELS.

A most important feature of the expense of rumning tunnels of any great lengtl, in this country has heretofore been absorbed in the suposed necessity for sinking air shafts, every few hundred feet. We have frequently alluded to the bad management, or rather, lack of knowledye of the principles of ventilation in uaderground operations, both in driving tunnels and in drifting per endicular openings, or shafts. A late number of te Virginia City Union gives the following very good plan recently adopted at the famous Latrobe tunnel, io Virginia City:
When this tunnel had reached a length of only a few hundred feet, it was found uecessary to siuk an air shalt, and at F street another; at this point the qottom of the shaft was closed up with the exception of a hole about ten inches square, through which passed a wooden box flume of that size, by which the air is conducted into the futher extremity of the tunuel. The draught is so strong, that notwithstanding the tunnel is west of A street, no other shaft has yet become necessary, and it is thought that no more will be required, as it will be brit a short time befure it connects with the works on the Comstock. A candle held at the month of the flame will be instantly extinguished: Throughont the Whole of the great distance which this flume supplies with air, the tunnel is cool and pleasant, and a person can treath with almost as much ease as in the open air. This plan of ventilation was first suggested to the superintendent of this tunnel, we understand, in reading the translation of an old German work on mining.

The Latrobe tunnel is now in about 2,600 feet, and is in daily expectation of reaching the ledge, (Coun-tock,) which it will strike at a depth of 465 feet from the surface.

The Santa Fe mine, also in the Virginia City district, is ventilated on a similar principle. A tin tube, some four inches in diameter, is connected with a tall wooden flue standing in and reaching to the surface of an sir-shaft, and ruming back from the bottom of the shatt to the furtherest end of the tunnel, where the drifters are employed.

Mexican Mines near Guymas.-A correspondent of the Bullitin, writes as follows from Guymas under date of May 20th :

A* to mines, the machinery of Los Bronces is nearly up, and will be all in order by Angust. Guasapares, Judge H ard's place, is now about running. Judge Butt's Alamos will be running in a forwight. La Prieta-engiue up, and will run within three months. San Marcial Silver Mining Company is well on. Crucecitas will probably be in operation in September. In bonauza are the following ; Bronces, Cabbi, Cotera, Lambona, Cruccitas, Fresnol and some others. The mines of Cerocohni (Nauggue de Cristo) and the Dios Padre, so presistently alleged to be in bon.mz, [prosperty] hy that veracious sheet, the Alta-I dare not say of course, for private and weighty reasons-I again assert to be still in dead nork, without true ores; and 1 challenge any proof to the contrary.-Bullition.
In Chihuahua, the mine of Le Crun, Pastrana, and those of Robingson, San Pedro-both in Batopilas-are in bonenza. Col. Allen's mine in Urique is a second Ophir ; the amount of silver extracted daily is only limeted by the capacity of the hacienda. The ores are very rich.

A New Cod Fishery.-It has been known to whalemen for some years past that good cod fishing grounds existed on the Pacific coast, some fifteen days sailing from the Russian port of Petropauloaski. The first fruits of these fisheries, so far as we have any kowledge, arrived at this port, a short time since in the brig Timondra, which brought in some 15 tons of the genuine article, equal in quality to the best ever caught on the Atlantic coast.
An extensive fishing ground of this discription in the Pacitic. Ocean must soon become of vast importance not only in an ecnnomical point of view, but also as a nursery for seamen. It is chiefly from our fishing grounds that the Government, in its present emergency, has been enabled to obtain the great number of seamen needed to man our rapidly augumenting navy. We need just such a field in this quarter of the globe as a nursery for the future commerce that mast grow up in the Pacific Ocean. It will be wisdom and economy for Government to protect and encourage it, by bounties, as heretofore at the East.

Tamre are in the United States more men and estates that can be assessed for one million dollars each, than there were. at the close of Revolution, that could be assessed for ten usand dollar each.

## [For the Mining and scientific Press.]

Virainia City, N. T.,
Ост. 2, 1863.
Eid. Press.-I should have writien last week, aceording to promise, but business prevented, and I am hardly in writing trim yet, as I wish to obtain undoubted information on every subject that appears in yous colomas from my pen.
The great excitement here now is Reese River, and to such an extent has the stampede that way increased, that all kinds of business here is almost at a stand still. 'This and the coming on of cold weather, have rendered Virginia dull for a time. We have fabalous reports of the richness of that country, hut 1 have seen such excitements and heard such reports before, and an not easily led away by them. I believe that "Reese " is a very rich country, but I kown that Washoe is; that its mines are now fully developed, that its resources are boundless, and I have no doubt that many of those who are leaving good bnsinesses and comfurtable homes for a place where all the known mines are located for miles; with the prospects of a severe winter, scarcity of provisions and lack of shelter, will return to the rich field of Washoe.

The standard mines here are pursuing the even tenor of their way, doing au amount of work and expending sums of money, that must be seen to be belived, while what are termed "outside mines" are working wi.h wonderful energy. Rich indications are being discovered north and south of this place. In a short walk, last week, over the ridge below Gold Hill, where two or three years ago a man who would think of prospecting would have been thought visionary or cracy, I found some fifty deep shafts and tunnels, nearly all provided with heavy hoisting apparatus, worked by horse power, and on several claims large steam engines are being set up. The indications are as grod as those in the best mines here, and and when one or two of the "lodes" commence turning out rock for the mill, mark my words, there will be an excitement exceling any yet, and shares that now sell for $\$ 5$ and $\$ 10$ will count high in the hundreds; on the north, although not as fully developed, the prospects are as good; while on either side of this range the rich lodes are being energetically prospected.

So much for a general birds-eye view of Washoe as it appears to a returued Pioncer. In my next 1 will endeavor to particularize some of the most promising lodes, etc.

QUILL.

## THE DISCOVERER OF ZINC.

Zine was first discovered in 1530, by no less a pesonage than Theophrastus Aureolus Bombastes Paracelsus, the wild fantastic hero of Browning's celebrated dramatic poem. It will, berhaps, be new to most people to be informed that the very word "bombast" took it origiual meaning in the "great and swelling words of vanity" uttered by this singular genius. He it was a ho gave the deathblow to alchemy, and was first to show the ufter hollowness of the then prevailing scholasticism, as respected physical investigations. Being appointed to the first professorship of chemistry, at Bale, in 15\%9-the earliest chair of chemistry ever established-he played such mad pranks, and kept up such a storm in poor little Bale, that the magistrate had to banish him from his chair. After undergoing many alterations of fortune, it irks us to say that poor Bombastes, to parody a mordern phrase, "went to the zinc," and died miserably, in an obscure tavern in Salisbury, in the 48th year of his age.

Japan, just at the present time, is engrossing much of the world's attention. They are a people far superior to the Chinese in point of inteligence and will be likely to prove very stubborn in their disinclination to come up to the present ideas of civilization and progress, and of en their ports, at the demand of the nations, to the commerce of the world. They are far less vulnerable than the Chinese, from the fact that all their important cities are in the interior. They have undoubtedly profited largely by the recent limited intercourse with foreign nations in supplying themselves -with materials and skill in all matters partaining to war. Destiny, however is against them, and their prond Damios must bow to the fat of civilization and progress. Our late naval visitor the Wyoming has most nobly opened the ball. Bye-and-bye we shall see what we shall see.
Fverything is cheap in Japau. A first class house can be purchased for $\$ 30$. Servants work for 50 cents a month. For the use of a horse and groom one week, with food for horse and groom $, \$ 1,50$. A person can live comfortably i Japan for two cents a day, or fourteen cents a week.
virgenia city atock list.
Corrected for the Milung and Escientific l'reess, Thurbday; Oct. 1, $188 \%$

Tin-Lined Lead-Pipes.-It has been frequently propose to line lead-pipes and cisterns with tin, in order to prevent $t l$ oxidation of the lead and the contamination of the wate This proposal has recently received an emphatic rebukè the Liverpool Chemist's Association at one of their la meetings, at which specimens of lead-pipe and sheet-lea electro-plated with tin, were exhibited, and some discussil ensued respecting the wie of lead coated in this manner f water-cisterns and pipes. It appeared to be the opinion the meeting that the coating of tin, instead of preserving t lead, was far more likely to ensure its more rapid corrosio for, if the coating of tin by any means happened to be seratch off, even to the slightest extent, galvanic action would to place, and the lead would be destroyed very quickly. I Nevins and Dr. Edwards stated that their experiments h proved that such would undonbtedly be the case; Dr. 1 wards remarking, that in one case which he bad examin a cistern made of lead, in which was an accidental adm ture of tin, was eaten out by well-water in six months, 1 lead being rapidly precipitated in the form of sulphate.

The Suipping Interest. - In our late exchanges 80, remarkable facts are given touching the maritime inter of the country. An Eastern paper states that during first half of 1860 , the number of vessels clearing from port of New York in foreign trade was 1,795, of whicl 123 were American and 662 were foreign, showing a differe! of nearly 100 per cent. in favor of American vessels. C paring this statement with that of the present year, an ast ishing change is apparent; the whole number of vessels el ing foreign ports was 2,167, of which only 747 were An ican and 1,450 were foreign. The interest of American : owners are suffering in all parts of the world, and large tr fers of tonnage have been made to loreign owners and protection of foreign flags.
San Francisco forms no exception to the general rule, there are to-day more foreign flags displayed by shir in the harbor than at any previous time. Among the eign shipping now here are vessels belonging to Pro Denmark, Hamburg, Bremen, Lubec, Russia, Great Bri Sardinia, and Colmmbia. The high rate of insurance ged on account of the ravages of the rebel steamers $A$ wa, F:orida, etc., has to a great extent driven Americar sels out of our service for long foreign royages, and consequence vessels of other nations are doing the car trade.

St. George,

New Shakl. Store:-On Saturday evening Mr. J. D Robert opened his New Shawl Store, No. 123 Montgomery street. We notice, until late in the evening an admiring crosd gazing at the beautiful patterns displayed in the window. No greater variety of patterns, richer in hue or finer in texture, can be found in London, Paris or New York, then are here displayed by Mr. Robert, from the richest Persian camel-hair down to the lower grade of American woolen, We wish him success in his enterprise.

Mr. H. B. Sontag, at the Mission, has one thousand thriftylooking tea-plants of this years growth, from seed procured by a Gentleman in China. As tea-plants must be four years old elapse before the success of the experiment of growing tea in California can be determined.

## ESMERALDA.

The mining share market in this district, the past week has been quite active, a considerable amount of stock having cbanged hands at advanced figures. The Cortez consolidated and Clan Alpine having been sought after at a slight advance over quotations.

The Geraldine on Silver Hill, south of the Young Winnemuck is down to the depth of about 30 feet; the ledge is four feet wide, and prospects rich in silver, the rock is similar to the Yancy and Seymore on the sams hill.
The Broadiead, on the top of Silver Hill, about 40 yard south of the Young Winnamuck, is a well defined ledge, and from present indications will yield as rich returns as any elaim on that hill, the claim has been but little worked, but the rock is rich in both gold and silver.
The Walrath tannel on the south-west side of Silver Hill below the Antelope is now in, a distance of 260 feet; the tonnel is five feet wide by $61 / 4$ feet in hight. The work is progressing day and night. This tunnel was located early this
Spring and is being prosecuted with more energy than any one in this district. Therein, four ledges have been struck, one of
which, (a blind ledge,) is even 12 feet wide, and assays $\$ 134$ per ton. The stock is mostly owed in San Francisco and sune of it is uffered in this market.

[The following letter, dated Sept. 24, 1863, from qur regular Esmeralda correspondent, was intended for our last issue, but did not arrive until after we had gone to press.]
Since I last wrote you there has been no change, to quote, in the stock market of importance. Owning to a compromise about being made between the "Utah" and "Cortez Con" solidated Mining Company," I learn that the Cortez stock is held firm at $\$ 15$ and but little offering.
Sixty shares Clan Alpine were offered to day for $\$ 12, \$ 9$ bid.
The Del Monte and Pond companies on Last Chance Hill are again working their claims with renewed energy. Since Monday last, the Del Monte Company have had 150 men at work taking out rock, which is being crushed at Messrs Starks, Fogus \& Lake's mills; the four mills are running day and night on the Del Monte work.

The Pond Company have about sixty men employed tak0 .ins out rock, which is being crushed at the Uvion Mill.

The rock now being taken out by the two companies is richer than any heretofore crushed in this District, ranging from $\$ 100$ to $\$ 300$ per ton.

Lake \& Minter's mills, on three days run on the Del Monte, cleared up $\$ 1,800$.

The Clan Alpine on Last Chance Eill is still being worked day and night. The work increases in richness as the work progresses. The shaft is down to a depth of about sixty feet, and the company are drifting north and south on the ledge. The last crushing of 40 tons, at Lake's Mill, yielded $\$ 80$ per ton.

The Mina Real Consolidated Mining Company are about letting a contract to run a tunnel, commencing on the west side of Martinez Hill, to be run a distance of 200 feet.
The tunnel will strike the Cash Lode, last Entension of the Juniata and the Mina Real Lode at a depth of about 150 feet. The rock from the Cash Ledge, (consolidated with the Mina Real,) pays $\$ 60$ to $\$ 80$ per ton. The ledge is about 11 feet wide and iucreasing in richness.

Hardening Wood and Pollies.-An exchange says, "Af ter a wooden pully is turned and rubbed smooth, boil it for eight minutes in olive oil, then allow it to dry, and it will ultimately become almest as hard as copper."
Will not such a process prove an effectual check against the possibility of expansion and contraction from the effects of moisture ; and if so, why would it not be useful in application to pick and axe-handles, etc.

Arming Mal Strabiers.-It is announced to be the intention of the Pacific Mail Steamship Company to arm the new steamers which they are about to dispatch to this side. It is the intention to place on board of the ships, ten 20 -pound Parrot guns.

Pateit Clatas.-We will furbish, on application, the claim of any invention that bre bern pateuted within the last fourteen years. The name of the patentec-date of pateut, when known, and two dollars for conying should be scot.

MOnLss.-luvelltors will please attuch to all models sent to uH , their names and address, in a legible, permanent form, this will avoid confusion and prevent errors.

Drawngs. - We have bighly talented and effecent Draughtemen, hy whom drawings of every diseriptions are executed in the best style of art, with promptitude, and at a moderato cost.

## WANTED

By a competent person, the Secretaryship of four Mining Companies. Bouks to be bept at the Office of the Miving and Ecientific Press, No 57 Goverument House. nquire as above.

## WHEELER'S Amalgamating and Separating Pans.

It is acknowledged by all who have examined the principles and witnessed the operation of these l'ans, that
they are decidedly superior for trituratiug and amalga they are dendedly superior for trituratiug and amalga-
mating purposes to any other in uso. mating purposes to any other in uso.
The mnst importaut principle connected with the ope
ration of thesc paus is the sceparation of the tritorating process from thet of extractiug the amalgam from the saud. The chief cause if loss of the precinus metals ari ses from the passing of of the same in conubination with
the quiclsslyer, during the proces of trinuration, aud in the quicksilver, daring the proces of trituration, aud in
cleaning up Py the introduction of the Separating Pan
to fow the trituration this loss is entirely arnided. In wroking these manchines there is uo appreciable loss of zuicksilver, und beace nune of the precious metaik.
Where these Prons bave been introduced and operater Wy the side of otbers on sands from the same vat, the
Walls have muforinly gaimed a Iarge perecotage of metals over its comptilors, as well as a still larger parcentage in the amount of work performed.
*** These Pans man be seen in daily operation, at th Hiuer's Foundry, on First street in this city, where a
nterested are invited to call aud exanuine for thomselye 3016-4

No. 22 Fromont strcet, bet Market and Missio
San Francisco, July 14, 1863.

The Rrisutend.-."Cosmos" of Tirginis City, in speaking of the extrourdinary rubl for Reese River, satys:
"Speaking of Reeso River a gentloman who had just come in from there, says he pussed 400 wagons in the distance of 70 uiles, fund as he had an eye to the fuir, he anys there were 72 women in the crowd, rushing onward. Verily the mipratury wave which for so many years has beell moving unward with the cry ot " Westward, ho!" having met the waters of the I'acific, now rebounds in its eagerness for new lands, and Lastward it moves, to till up that uninhabited space which lies between the sierra Nevadas and the westeru limits of the W'estern States.

Camel 'I'rain:-A train of camels is monning from the Humbuldt salt mines to Virginia City, packing salt for the Humboldt salt campany This is found to be a cheap mude of transportation. Each camel is able to pack from 800 to 1,000 pounds. It costs nothing to keep them, as they will fat on sagebush and greasewood, and the deserts which are so hard on horses and mules, are just what cumels thrive on.

Mumificent Banker.- Peabody, the American banker, in London, has signitied a desire to give Yale College one hundred thousand
dullars for a geulogical fund. Although l'ear dullars for a geulogical fund. Although 1'ea-
body does not reside in his native country, he does not altugether neglect or furget it, as may be seen by his may acts of munificence to our public institutions.

Treasurf from the North:-The Steamers from the North are now bringing down large amounts of treasnre every trip. The Brother
Johnathan, wich arrived on Monday, bought $\$ 294,600$. Of this amount $\$ 259,640$ is from Portland.

Eye, Ear and Throat.

## REMOVAL.

The Office of the Minino and Scirntific Prras, has been omoved to Rooms Nos. 56 and 57 Government House, corer of Washiagtun and Sansome Streets. We have been hidaced to make this change of location, not only with the fiew of secaring nurre room and better accommodations for arselves, but chiefly to better accommodate persons having ubinese with the office. Oar location is now central, easy f access, and in the direct way of the chief travel of the ity to and from the Post Uffice.

## THE STATE FAIR.

The State Fair, at Sacramento, although not all that could desired, and much inferior to others which have preceeded - was nevertheless quite creditable to the State. Ill health fevented our being able to give it that personal attention hich we should have been pleased to have done. The two three hours we were able to remain in the Pavilion was proted mainly to examining minerals and machinery, and of em only can we speak.
The display of minerals was quite extensive, but the total fak of classification and the unfavorable light in which most them was displayed, rendered any extended or careful ex himation of them quite impossible. The number was very ge, and many of them were very rich. There were out 200 entries, embracing several thousand specimens, inading gold, silver, copper, lead, tin, cinnebar, coal, gypsum, he, soapstone, building stone, sulphur, salt, etc. The sight this department alone, was well worth a visit to the Pa ion.
The district and region of Virginia City, althrough the ad-quarters of mining, was bat poorly represented. We ticed specimens from only the Ophir, Mexican, Savage djazet and Yellow Jacket.
Esmeralda was much better represented. She exhibited d, silver, copper and tin. The tin ore from the Hank from lode attracted considerable attention. Some twenty\& of the principal mines of this district were represented. Gumboldt was represented by samples from fifty o thy of her mines, among which we particularly noticed, te a number in charge of Mr. T. L. Wilson, several o foh-as the Wilson, Ferguson, Wallace, Miami, Monito se and Ophir were beautiful.specimens of bromid, a very val thle and rare ore of silver. Mr. W. also exhibited fin Elcimens of chlorid of silver.
Reese River, was probably the most fully represented of any syle district. The ores of this region were chiefly in charge cMr. G. F. Sember, who had on exhibition, as we under ind, specimens from 180 different claims, collected from a ation of conntry ninety mides north and sixty miles soath cAustin. Among them were quite a number of specimens Q fhloride of silver, which had been subjected to the action Wieat, the effect of which is to condense the silver in little gpules and flakes upon the surface of the ruck. The exbition of these specimens would have been much more usefiland satisfactory, if the exhibitor had placed similar and ndal specimens by the side of those which had been subjsfed to the action of fire. The light, also, in which the
most of the Reese River specimens were placed was extremely unfavorable.

A large number of specimens of gold and silver were on exhibition from various parts of California, some very rich and beautiful, but we were unable to take the necessary notes o particularize them as they deserve, which we much regret. The exhibition of copper ores formed a prominent portion in the mineralogical display. Ores were exhibited from Calaveras, Sacramento, Amador, El Dorado, Placer, Nevada, Shasta, Plumas and Del Norte counties. Some of the ores were very superior and in every variety in which this mineral occurs. We regret our inability to particularize.
No better opportunity is offered to our miners to bring to the attention of persons from various parts, the value and importance of their mines, than such an exhibition as that presented at the State Fair. People from all parts of the State assemble there at that time, to witness and compare the wonderful production of our skill, our soil and our mines. It is to be hoped that the experiment so auspiciously made to connect a mineral with the agricultural exhibition of our State, will be more fully and pefectly carried out an_ other year. More attention should be paid to arranging and and classifying specimens, and much valuable information might also be d ssiminated by a fuller system of labeling, so that persons unacquainted with the peculiarities of minerals might there be able to associate, to a greater or less extent, the name and character of minerals with their appearance. As it was, the exhibition could not be equalled by any other country on the globe.

## machinery.

The exhibition of Varney's Amalgamator, in practical operation attracted consideralble attention-and many were enabled to see for the first time. the operation of amalgamating gold by machinery. We have fully described and illustrated this valuable invention in a former number of the Press. Mr. J. Cammann, also, exhibited a model of a new amalgamator for which letter patent have been applie $f$ through this office. This machine is quite novel in its construction, and works upon an entirely new principle from any hitherto made. We shall soon give a full ullustrated description of this machine.
Mr. Elisha Hughes exhibited his patent Eyeless Screw Pick, which he is ahout introducing to the mining public. This pick has attained a combination of three important priaciples-strength, durability and convenience. It is quite novel in its construction. Mr. H. has made preparation for their manufacture on a large scale, in this city. When his works are fairly under way we shall give a full description of the instrument.
Mr. H. also exhibited a very useful and ingenious blasting apparatus, which be has recently patented. This apparatus will also be fully described in a subsequent nomber. It is something: which should be employed by every miner engaged in any kind of blasting.
Another invention which appeared to attract much interest, was a " tire-upsetter" invequted and exhibited by Ira D. Card, of this city. It is the ne plus u'tra of its kind and must soon come into general use. The patent for this machine was obtained through the Soliciting Agency connected
with this paper. An illustrated description of this machinewill soon be furnished in our columns.

Several other usefal and ingenious machines were exhibited, which we were unable to examine for reasons already stated. San Francisco was fully represented in the mechancal department of the exhipition.

## The Soledad Copper Mines-Los Angeles County.

The rapid development of these mines and the great influx of labor, indicate a prosperity that is almost unparalleled and unsurpassed by any other copper mining region on the Pacific coast. They are situsted about 30 miles from Los A ngeles, in a direct line north-east: By the present circuitous road, through the San Francisco pass, the distance is computed at 60 miles. By making a road across the mountains, to the foot of which there is easy access from Los Angeles, some 30 miles would be lessened, saving of course one half the present expeuse of transportation, etc. The cost of constructing such road is estimated at $\$ 20,000$.
The town of the district is called Rasenna City, and lies in a cañon between the mountains, which run in a direction nearly north and south. The mines are situated on the western slope, the principal ones bearing north.

Copper was first discovered in this region some eight years ago, by a Frenchman named Maris, who, bowever, failed to follow up the advantage of his discovery; and it is only about eighteen months ago, that a mining camp was formed and the district fairly prospected. Since then, remarkable progress has been made.
The climate of this region is very salubrious. Wood is in abundanice at a short distance, and easily obtained. The water is of excellent quallity, and is amply sufficient in quantity for mining purposes the year round.
The ores generally, from this district, exhibit a remarkable degree of purity, being almost entirely free from admixture with baser me als; they consist chiefly of red and black oxides, accompanied in many cases by the gray and yellow sulpharets.
There has lately been discovered a quartz lead in this vicinity, which exhibits very richly in gold. Of this I shall write further as developments are made. Among the principal mines may be mentioned the Maris lead-thia forms a portion of the property of the Soledud Copper Hill Og. A shaft has been sunk to the depth of 95 feet, and the ledge is now over seven feet in width. Grey sulphurets predaminate with a large admixture of gold and silver.
The Jesus Maria lead also belongs to the abore Company and is located in Soledad Hill. A lode of some faur feet in width has been struck. The depth of shaft at present, is about 25 feet, with improving prospects. The prominent ares are gray sulphurets with a considerable portion of silver,
The Marguerita, in the same district is being pushed for ward with great vigor. The present dopth of the shaft is 65 feet, sud it is confidently expected that 35 feet more will give expcellent pay rock; the ores flom the mine are principally the purple or peacock species, nerging into the gray and yellow sulphurets: This lead is undonbtedly one of the largest, richest and thost reliable in the district.
I may reiterate that the general advantages of these mines in purity and jield of precious metale, are unsurpassed by any
region on the Pacific Coast. region on the Pacific Coast.

## [From our Traveling Correspondeut.]

Stockton, Octooner 5, 1863.
$M_{\text {r. }}$ Editor:-In completing my report of the Stockton Fair, I must notice some articles on exhibition unintentional ly omitted in my last letter, but which, as matters of public interest, $\mathrm{I}_{\text {p }}$ promised to mention.
On referring to my notes, I find I made a mistake concerning the buge block of copper ore from the Keystone claim. which I am desirous of correcting. This splendid sample, both as regards its size and quality, lay immediately under those of the Napoleon, when I took my notes; and, being then, without a label, I necesarily concluded that it belonged to their specimens: I trust the Keystone will accept this amende honorable, as it truthfully explains the mistake.
In the horticultural department I omitted to speak of two magnificent samples of cotton, grown in this neighborhood; one on the tulares, the other on what is called the upland. The present condition of America has shown the im:mense importance of raising cotton in California, and these samples, I take it, settles the question. They are admitted by all acquainted with raising cottoi to be equal to any produced by the oldest and best cotton States, both in quantity and quality. If any superiority should be claimed for either sample, it was that frem the tulare ground, the cotton was more silky and fine. What a vast field is thus opened to California enterprise I Such portions of the tulares as are reclaimed, we know, produce the finest vegetables in the world, and now-it is demonstrated that they will produce the best cotton. With this fact before us, surely the Government ought to redouble its efforts to reclaim these millions of idle acres; and make them, what they are capablé of being made, the great cotton fields of the world. The sample from the tulares was raised by Mr. Paige, the other by Mr. Starkweather. The next article of home manufucture, comparing favorably with those imported, was a hox of prunes admirably packed ky West \& Brothers. They laid side by side with the best imported eamples, and it was difficult, if not impossible to tell the difference. , If any thing, the California samples were the larger and more pulpy; All they lacked was the rich glossy black of the foreign article and that every lady knows comes in time.
In speaking of diferent articles sent by the more prominent cities of the State, I omitted to do justice to the Pacific Glass Wdrks of J̇an Francisco. They had every variety of glass present of the highest order of merit. Their exhibition attracted much notice and praise. You will see by the published report, they and our friends, Messrs. Taylor \& Cor, paper manufactures, each took special premiums. Knowing personally, the liberal and generous character of the latter firm, I took the liberty of speaking of them as they deserve, and I sincerely coagratulate them npon the honorable notice their samples of paper received here.
TWith this, closes my account of the prominent articles on exhibition. I am happy to say the Stockton Fair has been entirely successful in every respect. The greatest justice and liberality were shown by the judges, and the fact of being a certain person, or coming from a certain place, was not the basis of their judgement of the merit of articles exhibited. The consequence is, their decisions lave given universal satisfaction, because they are felt to be just. The intire receipts ranged somewhere about $\$ 10,000$, of which $\$ 6,000$ will go to the credit of the Society. At the same time, nothing could be more cordial or polite, than the attentions paid to members of the Press. To Dr. Holden my acknowledgments are especially due. In this gentleman, the Society have a faithful, efficient and attentive officer. During the week, he was the recipient of two silver goblets-one from the members and officers of the society, the other from the attaches of his own establishment. Woll has he earned the distinction. Our paper is also under many obligations to Mr. Barratt, of the Beacon, for assistance rendered in various ways.

The excellent mining interests of this section are receiving proper attention, and large fortunes have been made by different parties: Mr. C. T. Meader, who now subcribes to the Mining and Scientific Press, as all ought who would make mining a successful business, is reputed to be worth over $\$ 1,000,000$-his interest in the Union ledge, the only one, perbaps, in the State having no shares for sale, being esti mated alone at $\$ 600,000$. But of this branch of local wealth I shall speak more fully as I extend my travels. I must, however, here acknowledge the obligations I am under to
a brother of Mr. O. T. Meader, for many civilities in prosecuting my special mission.
Thie ladies declare I must, not omit to say something about the Fair Ball. I beg to assure thein $I$ do notmein to do so, only I told them, I thought you would not publish what I said, as you were " not on the dance." I give you the chance of becoming popular forever; and gettivg all sorts of nice things should you risit these parts. Realy, it was one of the most agreable parties I have attended in the State. The San Francisco system of ladies dressing in bonnets and shawls is tabooed here, and a full dress costume is entorced. This is only just to those who go in full dress, as well as to those giving the ball. 'Taken altogether, the San Joaquin ladies are good-looking, and make a splendid appearance. understand some gentleman, comnected with the Press, intends publishing an account of each dress. That is far more than I dare venture upon. All I shall say is, a'ter careful examina= tion, that on this occasion, the dresses were all appropriate and becoming, generally beautiful, in some cases costly. Ladies I have redeemed my promise, and remain as ever your most obedient servant. Shall I say anything about the icecreams and chickens?
In former years we used to hear so much about abuse in the management-of the insane asylum that I determined to pay it a visit. Whatever it may have been in past years, it is not so now. It would be difficult to find anywhere, a better ordered, more cleanly, and well-arranged establishment The bedding and food were particularly good. But what a mixtare of pleasure and pain it creates to visit this establish-ment-pain at witnessing the sad condition of its iamates pleasure at seeing the efforts made to give them all the ma terial comforts they can eujoy! I confess it was with anything but pleasurable emotions I mingled with this crowd of madmen; but timidity soon gave way to astonishment at the idiosyncracy of eacly case, and the real harmlessness of the men themselves. Here before you are some two hundred men all living in a world of their own, and that world bounded by a single idea, upon which their minds, in this insane condition, eternally dwell, knowing nothing, feeling nothing, seeing nothing but their own particular grievance. The inmates are men of all nations, but nationality is lost in the wreck of mind. The energetic American, the phlegmatic Dutchman, the methodical Englishman, the passionate litalian, the vivar cious Frenchman, the savage Indian, are there before you, but the characteristics of the men are gone. Even in those cases, where they have become quiet and are grouped together in the yard, insanity is the most painfully oppressive sight I ever saw, or hope to see. There you have a large crowd of men in every conceivable and inconceivable attitude, some swinging, some lounging against the walls, some walking, some setting, some kneeling some lying down. You see they are men, but that's all. (Wjth one or two exceptions not a word is spoken. The most deadly silence prevails. Every vestige of sociability is lost. They meet this for months, perhaps for years, but every day meet and part as strangers, for each seems dead to the other, and all to live in their own sad world of one idea. Thas on walking about they never jostle or or touch each other; on setting down, never crowd each other; on taking the swings, they wait until they are unoccupied; they ask nothing from each other, give nothing to each other; take no notice of each other, and as far as I could see, were men only in the cupacity of moving, eating and sleeping. I had previously no idea that insanity destroyed so entirely the social nature of man; and yet, so intensely painful to behold, in other respects it is very fortunate. Were there communion of feeling or sentiment amongst the inmates of an asylum, there would necessarily be concert of action, in evil as well as good, and thus it would be impossible to govern them Apart from the lessons of charity a man learns, the attentions from the officers he receives, and some minor material gratifications he enjoys, taken altogether, a visit to the asylum is by no means a pleasant thing.

And now, sir; I have done; but before I proceed on my journey, permit me once more, to thank the Stocktonians for their civility to me, and to bid them God's-speed in all their undertakings.
L.

Low Whter.-The water in the mines and mining ditches throughout the State is unusually low at this timo. The season is pronounced the dryest one experienced since Califoroia became a State. The signis at present, however, indicate an became a State. The sigas at pres

## [From our Regular Correspondent.]

Mr. Edrtor:- Aeaving promised to drop you a few lines for your valuable paper, I will commence by saying that our mines, the principal source of revenue of this county, continue to yield bountifully. This remarls is not applicable alike to all the different localities, but to be taken in an average sense: Those localities in which the gold yield is dependent solely on the produce of surface ground, have seen, or will ultimately see, their sources refuse to yield the yellowstream; but those favored sections, where deep digging are found, have generally, an undisturbed and long future before them, and fortunately, there are many suctr in this county.
The untiring energy and perseverance of the miner, have as the surface clains become exhausted, developed and opened up; in our various minining districtas, vast subterraneous gold fields, which give renumerative employment to a vast uumber of workmen.
The most perminent among these discoveries is, probably, the region extending from Mokelumne) (All to the Calaverais River, along Chile Gluch, a distance of six miles. Some of the claims opened on this deep channel are among the beat if put the very best in the State. The one owned by Paul, $0^{\prime}$ Neil \& Co., I am informed, nets the sn ug little sum of one thousand dullars per month, to the share, and I believe the adjoining claims, of Lombard, Kit-or-miss and Calaveras, are nearly if not quite as good. All of the wash-dirt takon out of Paul, O'Neal \& Co's and the Calaveras T'unnel Company's claims is crushed before washing, and passes from the battery into sluices, where the gold is collected. This is the only safe way to wash hard cemented, tough or clayey dint, so as to concentrate all your gold in the sluices.

## QUARTZ MINES.

The Quartz Mining interests are duly represented in this county, but not to the same extent as in some other parts of the State. The regions about Augels, and Wdst Point, are the places, where the most renumeretive veińs are worked at present. This branch of mining has not yet recovered from the shock it received in 1851 and 1852. Then every. body owned a quartz mine, and nobody knew how to work one, which is, in a great measure, the case now with copper mines. For this reason, quartz mining became unprofitable, and it has not received that share of attention, which its importance demands; and entitles it to; but it is, nevertheless, ganarally working its way into public favor.
While speaking of quartz; let me inform you that a company in your city has incorporated under the name of the "Leon Loto Gold and Silver Mining Company," for the purpose of working a well known quartz ledge, which is located about ton miles east of here, and which I believe, undar proper management, will yield large returns to the company.

## water and ditches.

As in prospecting and developing the mineral resources of our county, water becomes an indispensible and necessary element, let me inform you, and through you, the Mining public, that a great portion of our county is a complete network of flumes and mining ditches and that water can be obtained at almost any place when meeded for mining par-poses, for about forty cents per inch. We have in the connty 68 mining ditches, with a capaciy of 10,000 inches, united length 583 miles, representing a cash value of $\$ 500,000$.
In my next I will speak of the copper interests of our county.
R.' ${ }^{\prime}$. D .

Captures.-The greatest capture of prisoners of war in modern history, up to the occurence of the present war io our own land, was that made by the first Napoleon at Aus terlitz, where that great conqueror took 20,000 prisoners. Gen. Grant's capture of prisoners, at Vicksburg, was, ir round numbers, 31,000 . Napoleon, at Austerlitz took 151 pieces of artillery. Grant, at Vicksburg, is said to have takel 238. Measure it how we may, the present War of Be bellion, exceedes in dimensions, all which have preceeded it It is the most gigantic conflict that the world ever beheld and the principles and consequence involved are fully com mensurate with the magnitude of the contest.

The Quicksilver mining company at New Almaden hav now 150 men employed in extracting ores, from a depth 500 feet.

## TO QUARTZ IIINERS.

A 11 persons interested in Mining Man examive ny improved Amalgamator. It is urquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 mounds at a time, and will amalgamate over three tons a day. By the motion
of the revolving muller, the pulp is drawa through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again ovar the muller to the centre, through the liolca and between the grinding surface to the circumforence as before. Thus a constant circulation of the pulp is kept ap, bringing the particles of oro and reducing the whole mass to an imvalpable
powder.
No quicksilver lies between the surfaces to be ground, out at the circumfercpesendic cotre of the pan where tho metal must pass through it es the pulp circulates. cember last, and all persons nre again warmed agamst

mators can be senem rut ing nt Denahuc's Fourcty, where
all can judge of then operation and the very superior style in which they are being manufartured.
sep21
THOMAS VARNEY.

## REESE RIVER CORRESPONDENCE.

Austin, Seft. 29, 1863.
Ed. Mining and Scientific Press:-I have just got up
from the universal mountain-fever, and have lad but little time to look around me for facts, the signal feature in your enterprising journal, but such as I have, I give unto you.
I think you have already a just appreciation of the vast mineral resoarces of this district, and perhaps it would be superfluous to repeat thein.
The rush here, is beyond precedent, and the cry is, "still they come." The accommodations do not keep pace with the demand, and many are compelled to take such quarters as would only do honor to a sheep-fold. Buildings are going up, such as they are, on every hand. We are sadly deficient in building material. All our lumber is brought from Carson, 180 miles westward, and readily sells for $\$ 300$ per thousand feet. Adobe bricks, made on the ground, sell at $\$ 13$ per thousand, and constitute the cheapest building material we have, but in the long run, may prove the most ex pensive. We have plenty of wood for fuel purposes, sufficient to last for some years. Stofe buildings are going up as fast as workmen can be found to raise them. Teams are crowding in, loaded with merchandise, provisions and lumber, but if the rush continues unabated, we shall look for a scarcity before Spring.

I have made some personal examinations of the mines, and pronounce the ledges innumerable and exceedingls rich. So far as I have examined, the ledges are narrow but invariably improve as the depth increases.

I have seen a number, back of Austin, and the maxinum do not exceed five feet. The Enterprise is down five feet, Toro 15 feet, Roderick 30 feet, Rough Diamond 10 feet; all about the same quality of rock, ledges narrow, but expected to improve as developed. Garibaldi; quartz one inch thick, but enclosed with good thick casing and $p$ omises well. Die Vernon Ledge is good, three feet wide. Depth of incline 58 feet. Morgan \& Muncey, in the same locality, is down 100 feet. Ledge only eight inches but rich. Ethan Allentunnel 100 feet. Ledge, 18 inches wide, with good lookirg 'quartz now stripping the ledge. Manhattan Company's incline is down 30 feet-ledge from four to eight inches of good rock. They have sarted anotier tunnel, further duwn the hill, and have gone in 16 feet. Oregon, near the latter, is down an incline 160 feet, and bave reached water. The rock looks rich, with a similar cast as the Savage. Virginia. I was much pleased with this mine, as the work is going on well. They use a flume. It is said, the Manhattan Company claim this ledge. Whether they hare any just claim or not, I am unable to say. Southern Light is working an incline-ledge three feet wide. Sarage Company has a shaft 45 feet in depth. Their ledge is three feet wide, containing grood rock.
In the cañon, between Clifton and Austin, there are four five-stamp mills in active operation, but defice it in pans. Two more ten-stamp mills are going up-machinery on the ground. The expenses here are enormons. Let him who expects to visit this country, calculate to pay four prices for everything he orders, and bring along a surplus of the "need ful," for ten to one, he will have use for it.
There is a good deal of sickness here, principally of the mountain fever type, which is manageable if taken in time. Meet it with a slrong will and plenty of blue mass and you will be all right in a few days, at least, sach was my experiance.
Ocr. 22:-I visited the Yankee Blade district, located in a north-westerly direction from this place, about three miles distant. Of this noted ledge, I regret that I was unable to reaci the best rock, now under water, but I saw some taken from the bottom of the incline, which is 75 feet deep, and it corresponded with a lot of fifty tons, now at Brook's Mill, undergoing the process of crushing, and I was informed by Mr. Brooks, himself, that it yielded $\$ 200$ per ton, About 12 feet from the water, they bave commenced drifting with the ledge which is a perfectly decomposed quartz; said to be rich, bat quite limited in width. The two ledges in the incline are but a few inches apart ; said to have unit d below the water, forming a ledge six feet wide. If that is the case, their pro-pects are higbly flattering. The propects of this mine, have induced handreds of adventurers to try their luck in that locality, and many are elated with the results; but how many on the other hand are disappointed, is best known
to themselves. It is seldom a man blows from the big end of the trumpet; and the public to know the facts, must wait until they are revealed by time.
The Whitlach Company has made the first extension south and are down 12 feet.
Cicero Company have an incline thirty feet down, and are taking out good looking rock. I could not go down on account of the blasting, therefore I cannot give the width of the ledge. The claim is held at $\$ 75$ per foot, but I presume the most obstinate holder, would yield to less seductive in fluences then these figures might offer, as man is frail, and gold is a great tempter.

Bunker Fill, said to be held by the Yankee Blade Company, is down 12 feet; ledge 20 inches wide-work suspended The rock is about the average.

Seely Co., Pizaro ledge, down fifteen feet. Ledge five feet wide.
Golconda Tunnel Company, in San Francisco cañon, have their tunnel in 50 feet-work suspeuded. San Francisco canon is about three-quarters of a mile from the Yankee Blade, in a northerly direction.
Ruby Company, located near by, has sunk an iucline 50 feet, and reached water. As far down as I could go, I fouvd the ledge 3 feet wide. I saw some splendid rock taken from below water-line. I understand this Company is being incorporated.
"Vidi."

## THE NORTHERN MINES-NEW DISCOVERIES.

The Dalles (Oregon) Mountaineer states that the mines east of the Cascades are now sending to the market of the world an aggregate of $\$ 1,000,000$ monthly, or $\$ 12,000,000$ per annum. This statement is probably sumewhat exager rated, altbough the past year has witnessed a large increase of treasure shipments from that quarter, and indications are that we may look for still further improvements in that direction. New and rich diggings are cluimed to have been discovered in upper Oregon, and a party of miners, headed by the discoverer, started a few weeks ago for a more thorough prospect. The mines are known as "Sinker Creek." With regard to these mines, the Dallas Mountameer gives the foluwing :
A tradition has been current for years that some lost immigracts, in 1845 , whilst wandering through the country drained by the Malheur, discovered mines where gold could be raked up by the shovel-full. At the time the discoverers were ignorant of the charact ristics of goid in its native state, and accordingly they passed on, regarding the metal as wurthless. A few years later, sume of these men were attracted to California, and on visitiug the mines there, almost their tirst remark was that they "knew where bushels of that kind of stuff was to be had." since that date scarce a year has passed that did not witness the departure of companies
of men who went out for the purpusa of discovering the of men who went out for the purpusu of discovering the country described by the iminigrants. These expluring par-
ties have uniformly proved fail res. owing, in a great useasure ties have uniformly prored fail rres.owing, in a great useasure to the hostility of the Indians, who have resolutely refused to allow the white man to prospect their country. At la-t however a party more fortunate than the rest have sncceeded in finding the long lost gold field, and if reports are to be believed, the story of its richness has not been exaggerated by the original discoverers. The "prospects" show that the immigrant boy was not particularly out of the way when he used a piece of native gold as a sinkry, in a country where the treasure is so plentiful that it meets the eye at every turn. Connected as this new discovery is with a tradition that has been current so long, it is not strange that is has been the occasion of great excitement.

## THE MINING SHARE MAREET.

The Mining Share Market during the last two weeks has met with material improvement, both in amount of business transacted and in the rate of shares. The Burning Moscow and Santiago have absorbed the largest amount of attention during the past week, for reasons which are fully given under their appropriate heads.
Ophir has slightly declined. The directors declared a dividend on the 6 th. inst., of $\$ 48$ per foot. This stock has been unusually active for the past two weeks, having been cheifly taken on foreign account. To meet this new condition, which has been in gradual progress for some months, the Company has made arrangements, whereby its dividends will be paid in New York, by Eugene Kelly \& Co., No 36 Wall street, the same day as at the Company's office in San Francisco.

Gould \& Curry has declined $\$ 50$, with small sales, though freely offered. During the past ten months this Company
has divided $\$ 1,350,000$ among its stockholders, egnal to $\$ 1 .-$ 022 per foot: in addition to which, besides paying enrrent expenses, the Company has made extensive and costly inprovements both at their mine and mill.
The Central still remains inactive-buyers $\$ 2,200$, holders $\$ 2,400$. It is reported that the Company has recently struck a ledge in their main shalt eleven feet in width.
Chollar which clossed the week previous at $\$ 900$, b. 30 , advanced during the past week to $\$ 1,050$, but finally closen at $\$ 980$.

Potosi has been enquired for at an advance of $\$ 100$ over the week previous without finding sellers. This C'ompany has recently struck very fine ore, the best ever found in the mine. We presume, from the firmness of holders, it is found continuous.
Hale \& Norcross has found buyers at $\$ 200$ over offers of the previous week. This Company is making extensive improvements at the mine, which when completed, uill make it second to nove in facilities for raising large quantities of

Imperial and Overman have each advanced somewhat with light sales.
Sierra Nevada has been but little dealt in; opening at $\$ 100$, closing at $\$ 95$. The hoistiag works of this mine were started about ten days since- The Company has done a vast amount of work within the past ten weeks.
Dany has slightly advanced, with considerble basiness. A new 80 horse power engine arrived at the mine, on the 30th. ult., to be used for boisting and pumping.

Burning Moscow has been the chief speculative attraction of the week and has been largely dealt in. Sales of 701 shares are reported. Opening at $\$ 155$, it fell $\$ 164$. Accounts of a bigbly flattering nature having been received from the mine, it suddenly advanced to $\$ 310$ on 30 days. The ores now being taken out are said to be beyond the disputed ground, and it is anticipated that the company, with present prospects, will be able to remit $\$ 25,000$ weekly.

North American has suddenly become unusually active Sales of 704 shares-one eighth of the mine-are reported the past week, at a somewhat fluctuating adrance from $\$ 621 / 2$ @ \$71, closing at the latter figure with a heavy market.

Buckeye has met with a large demand, at fluctuating rates. closing at an adrance of $\$ 4$ over last quotations.
North Potosi is again in considerable favor with large transactions.
Baltic advanced $\$ 10$ with large transactions.
Sacramento has been dull at $\$ 60$. This mine has been consolidated with the Meredith and will hercaiter be known as the Sacramento \& Meredith.
Spanish No. 2, has been in request at $\$ 45$, on 30 days. Santiago stock shortly since was considered a very good urestment at $\$ 175$ per foot, has fallen to $\$ 15$. Sanborn \& Co's Circular af Snturday, in alluding to this mine, says:-
"The higb price was based upon the returns from the mill of over 600 tons of ore, which yielded, on an average, $\$ 40$ per ton (as good as Gold Hill). [?] This ore, the Superin tendent represented as being the ave rage of the ledge. Upon this the price advanced to $\$ 175$; and one of the Trustees, an intimate friend of the Superintendent, and who held a large interest, sold out ncarly all his stock to first class operators. Later runs at several mills, only produced $\$ 13$ @ $\$ 17$ per ton. Hence the cave-in in prices; no more of the $\$ 40$ ore being forthcoming."
We refer to our usual quotations and sales of the week.
Esmeralda.-Wide West has advanced from $\$ 67$ to $\$ 75$ in this city, with considerable demand. This Company is now running its mill on Real del Monte rock; meantime work is going on at the mine, preparatory to further facilities for getting out ore.
Pond is not quoted-there being no stock in the market. The company is actively engaged in operations at the mine, 80 men being there employed. They bave now three mills employed crushing their ore-the Brodie, Enion and Gregory's mill. Sixty-five tons of ore from the ground in dispute between this company and the Del Monte recently crushed at Winter's mill yielded $1,140 \mathrm{oz}$. amalgam, worth 88,464 . One handred tons at the Brodie yielded 2,500 ounces.

## COPPER.

The copper interest manifests no abatement. Notwith standing the fact that we have as set but one dividend paying copper mine, (the Union,) within the State, and that an unincorporated company, there is, nevertheless, no lack of confidence in the success of many of the leadiug mines now in

Firemen Attention! In our advertising columns will be found a card for Mr. J. D. P. Wilkins, of Stockton, the celebrated harness maker. Mr. W's hose, has long been used by the Fire Companies of San Francisco, and we believe, gives entire satisfaction. There is no doubt, it is a very superior article; and, we cordially recommend it to our numerous friends of the Fire Brigade of this city.

Patent Clanms.-We will furuish, on application, the olnim of ang invention that has bewn pateuted within the last fourteen years. The name of the patentee-date of patent, when known, and two dollars for copying should be sent.

Moduss.-lurentors will please attach to all models sent to us, their names and address, in a legible, permanent form, this will evoid confusiou and prevent errors.

Drawiags.-We have bighly talented and efficient Draughtsmen, by whom drawings of every discriptions are axecuted in the best stylo of arl, with promptitude abd at a moderate cost.

## WHEELER'S <br> Amalgamating and Separating Pans.

It is acknowledged by all who hare examined tho prin ciples and wituesaed the operation of these Tans, that
they are decidedly superior for trituratiug and amalgawating purposes to ady otber in use.
The mnst important principle connocted with the operation of these Paus is the separation of the triturating
process from th. tof excractivg the amalram from the process from th. the exief ciusc of luss of the precious metals ari-
sand.
The ses from the passing off of the same in combination with
the quicksilver, during the proces of trituration, aud in clenning up By the introduction of the separating laan to $f$ llow the trituratiou this loss is entirely araided. In
workiug these machines there is no Working these maschibes there is no arpreciable loss
puicksilver, and lience none of the precivus metais.

Where these l'ans hare been introduced and operated Wheeler thaus havo un sinorms from the same vat, the Wheeler Paus bavo uniformly gaiued a Iarge percentage parcentage in the amount of work werformed. ** These Pans man be scen in duily operation, at the Miner's Foundry, on First street in lins city, where al 2016-tf ZENAS WHEELER.

## MINING \& SCIENTIFIC PRESS.

MHE ONLYMINING, MECHANICAL AND SCIPNTIFIC PAPER ON THES CONTINENT.
third yearl volume vinnew serirl
A new volume of thls extonsively circulated paper commenced Sept. I1, 1862 . It is intended that every number shall bo replete with information concerulhg Mining, Scientific, Mechanical and Industrial pursuits toge of prepared expressly for its columns. This paper is devoted to the alove purposias, together
The with the interests of Scieuce, Arts, Agriculture and Comworce, and any general information that may be of interest to the reader: and it is the intontion of the pro prietor to spare no pains or expense in masing it equal
io interent and valuable jaformation to any paper yot published The Mining Interest
Will ind it of great valuo, as it will contain all the news appertaining to Mining, the prices and sales of M1
ning Stocks, new inventions of Machinery adap purpose, and of ovorythng generally that may be of service to the Miner.

The Inventor !
Will ind it an excellent medrum for the purpose of briaging his invention into notice, of ascertaining an
progress of iavention in this aud other countries, an almo of receiving any information that may be neces sary in obtaining his patent, the proprictors haviug had great oxperience as Patent Ageuts, together with facil
itios at Washington that enable them to obtain Patent ties at Washington that onable them to obtain Patont
with diupatch.

Пhe Mechanic and Manufacturer
$\qquad$ ings of new machines and inventions, together with a large amnuat of readlag matter appertaining therota We are constantly receiving the best scientife jour-

To Chemists, Architects and Millwrights. This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of infor-
mation of great service to Architects and Millwrights mation of great service to Architects and Millwrights
will be found in our columns. The Farmers and Plan-
then ters will not be neglected, engravings will be given of erally will be amply discussed.

## Terms.

To mall sabscribers:-Four Dollars per annuma Club Rates
Five Coples for Six Months, $\$ 8$.
Ten Copies for Twelve Months, $\$ 30$.
Names cas be sent in at different times and from
diffrent Post-offices- Specimen copies will be sent-
gratis to any part of the country.

## OUR MINING DIREOTORY.

We devote nearly the entire of to-day's issue to rur Mining Directory. We have added to the list about 300 companies, removed about the same number of such as we have heretofore been giving by their titles only; their Secretaries not havieg considered their existance of sufficient importance to the public to hand in the locality of office, etc., for iuser-
tion in the Directory. : In addition to the above changes, we have made several hundrel c orrections and changesthe most of which we have sought out by diligent enquiry.

## ESMERALDA STOCE MARKET.

There is but little change in the Stock Market since the ast report from this District.
The Lexington Ledge, on Last Chance Hill, is again being worked, the new shaft is duwn to a depth of 60 feet; the ledge is over six feet wide, and the rock iucreasing in richness. The company have about forty tons of roek taken out, lying at the shaft, ready to be crushed, so soon as a mill can be secured. The rock is said to be equally as rich as the Cruckett or Westeru summit.
The work or the Clan Alpine Ledge, on Last Chance Hill is being prosecuted day and night; the shaft is now down to a depth of sixty-five feet, and the company are drift ing on the ledge-fourteen tons of the rock crushed at Lake' mill, on Wednesday, yielded $\$ 1,382$. The compaay have declared a dividend of $\$ 1,50$ per share on the 38 tons of rock crushed at this mill. The work will be continued, but no more rock will be crusherl until the present contract of this mill on the Pond rock is completed.
The Clan Alpine Company are sanguine that the next crushing on their rock will go over $\$ 90$ per ton.

We are compelled to defer our usual Mining Stock Report for the week. Considerable changes have taken place in the market, for which we refer to our usual lists of sales, for the week.

## REMOVAL.

The Office of the Mintig and Scifntific Press, has been removed to Ruoms Nins. 5 fi and 57 Government Hutise, cor ner of Washinerton and Sarsiome Streets. We have lieen induced ti) make this change of location, not only with the vew of securing mu re room and beter accommudations for ourselves, but chiefly to better accommodate persons having Wusiness with the office. Our location is now central, easy pf access, and in the direct way of the chief travel of the city to and from the Post Office.

THE ANTIOCH COFPER SMELTING WORES.
We are informed that the Califormia Copper Sinelting Works re progressing favorably; of course the superintendant has o expreriment to a certain extent upon some of the refracory materials used in the construction of some portion of the furnace. We are told, however, that so far everything looks ke a complete success. The Cumpany also seem to be satbfed with the obtained resulte, and a proot of that is, that bother very large furnace is in the course of erection, and patout ten days will be ready for working. We see no pason whatever, why copper smelting. will not be a safe and are investment as any in California. We have an abung withoat a doubt. Parties can obtain coal as cheap here they can in most of the Eastern States; copper works and e copper ore much cheaper. Our own requirements for pper will be pretty considerable, and is already quite large. e shall be pleased to see the California Copper Smelting forks supplying this demand. On the strength of this her large manufuctories will start into existance-such as te producing of the various copper impelnents and apparatas fed for manufacturing and domestic purposes. We can allook forward to the production of brass. The success of a enterprise cannot be over estimated, and it deserves the and grod will of every Califoraian. Why cannot CaliInia supply the demand for copper of China and various fher places. In such a large seaport, considerable sheath will be required for ship bottoms, and cannot we expect 1. Antioch Copper Works to fill this want, at some day, early ithe futuren 'I he Company will soon have a few tons of raufactured copper ready, although at present they have in Whe only the concentration of the ores, so that none may We their works assaying less than 50 per cent. of copper. Then these works are in full working operation, copper mies that will not pay now. cau be worked to an immense Fit. Mines producing even five per cent. of copper will enfuully pay. They would pay even now if parties were to pi pp machinery on their works, and dress their ores; and uil this is done, copper mining can not be profitable in the mfurity of the mines of this State.
he Alta Califorvia Copper Mine is located in De N'te County, about eighteen miles from a good shipping pait. It was incorporated in 1860 . It has an incline 250 fe deep, and is now shipping 20 per cent. ore. It is one of thumast promisiog mines in that county.

## [From our Traveling Corrempurdeat.]

## COPPEROPOLIS.

Mr. Editor:-I have now commenced in eamest the busiuess of my special mission; and as one of its principal ob jects was to cullect all the information I could of this wonderful district, which might be interesting to the community at large, I shall begin with a short notice of t"e town itself Copperopolis is situated some thirtr-five miles above Stock ton, a little south of east. six miles from the sitanislats River opposite the Central Ferry. The main trivel, however; to Sonora and Columbia, and that section of the country, passes over - Ferry. where they are building a magnificent suspension bridge, at a cost I understand, of $\$ 20,000$.

The town stands upon a'site admirably adapted for the large and important city it is destiued soon to become. It's present dimensions, indeed, are quite respectable, corrsidering it is only two years old. A mong it's principal buildings are Col. Manning's hotel, a large, commodious house, conducted admirably, and affording better accomodations than you get at Sitockton; where, by the way, in this respect, they are sadly behiad the times-the Catholic Church, Mr. Hardy's private residence, and the public works of the Union and Keystone mines. There are also two livery stables doing a good business, several large stores, Ice Cream Saloons, and about the usual amount of bars, though so far as I hare seen, people, for a mining town are very temperate.
The population, I beliere, is about twelve huudred; amongst which the Cornish and Irish miners form quite an item. There are two schools, one public and one private, with about an equal number of pupils; and the general Sab-bath-school, with an attendance of 60 children on an average. I do not know whether they bave a resident minister, but a a matter of course, there's a Doctor and a Lawyer. The lat ter are inevitable everywhere: I was rather surprised to find the Protestant resideots have not built a suitable place of worship, considering the population, and the permanency of the mines; bat, at present, Divine Service is held in the public hall, a respectable building, standing in the centre of the town, which also answers for theater, ball-room, etce., as casion requires
The valley through which these rich and extensive copper deposits run, is surrounded with hills well timbered, and containing a soil capable of producing anything. The gr at draw-back to agricultural pursuits at present, is the searcity of water; but, to obviate this, a large company have commenced a tunnel into the high bill on the upper side of the own, with a view; principally to strike water, and, if success ful, as no doubt they will be, then Copperopolis, in this repect, will very soon be a second Coloma; where every man its hterally "under his own vine and fig-tree."

## the mines.

To visit each mine seperately as Fintended, and to render my description intelligible to strangers at a distance, is a work of labor, consuming considerable time. I ano however making all- possible progress, consistent with it's importance and, here perbaps, is the proper place to acknowledge the extreme politeness and consideration with which all parties treat me, and the assistance they afford. Wheuever or
where I want to go, there's a bugry at command. At the fitiong time, as in gratitude bound, I shall mention each party by name. On presenting friend Elmore's introduction to Mr. Pike. Wells, Fargo \& ( 0 : ${ }^{\circ}$ agent here, he amanged immediately to have a conveyunce for me the following moming; when accompanied hy Mr. Johnson and Col Manning, we all started to visi the Massachusetts, but as this miue is not upon what is called the Copperopolis lode proper, I shall omit it's description now in order to avoid coufusion. At present I shall confine myself to those stretching from the town to the river, a distance of six miles, and give them, serialim, as they follow in succession. First then comes

## tae union.

Of this claim I am unable to give any particulars as the authorities, for reasons best known to themsel res, refuse admission. All I can say is, that a portion of it runs out from the town towards the river until its joins the

EMPIRE.
This mine stands high. Their main shaft is about 110 feet deep. It's exteat is 1,800 l'eet, containing twelve shares. At present they are not at work below, so I did not go duwn. In a short time, this will be one of the leading clains.

This mine follows in a direct line upon the main lode, and in the adrancement of 1 t's works, stands next to the Union and Keystone: It is almost incredible, the amount of work done upon this claim. It contains 3.000 feet divided into twenty shares. The main shaft is about 110 feet deep. Over this shaft they have pui a splendid little engine of 20 horse power. with 10 inch cylinder and $1 / 1 / 2$ feet stroke. The engine is intended for hoisting ore, and pumping. The pump will be a plain lifting pump about 8 inches in diameter. All these works will be completed very soon, The machinery whs manufactured in Stockton, and rellects great credit upon the Globe Foundry. In sinking an air shaft, about 100 feet above the engine house; they recently struck a magnificent deposit of ore at 30 feet deep, which was reported at Stockton to contain 30 per cent, sulphurets. I forward three samples of this ore, for your cabinet collection, which I picked up this morning, out of a large pile equally good. For three long years, the owners have had untiring faith in this claim, and like all faith accompanied with good works, it will reap the final reward of success.

## columbue.

Yesterday Mr. Beardsly very kindly offered to drive me round. Our first visit was to the Columbus. This claim is only just opened. They do not expect to strike anything of consequence until 100 feet deep. They are now down alout forty feet, with strong indications of good ore The claim contaius 2,400 feet divided into 16 shares. I think myself that thirty feet more of tunneling will make quite a difference in the value of this claim.

## fryouth rock.

This clain is also only opened. It consists of 2,500 feet, divided into 18 shares. They are down 40 out of 150 feet which they expect to have to sink. Indications good.
colyer.
Immediately opposite the Plymouth and adjoining is the Colyer, only a few hundred feet apart. Both are prospecting
for the main lode, with equal chances of success, as through this point it is difficult to guess the exact bearing. The Colyer takes the flat. The claim is 1,200 feet I believe: At present no nork is going on, owing to the accidental death of Mr. Colyer, a short time since, from a premature explosign of a blast.
mebster \& alta consolidated.
Next follow these two claims, also running parallel and d rectly opposite to each other, 1 ke the preceeding. Neither are working below. The Webster people were driven out by water and are now driving a tunnel. The Alta suspended work from some misunderstanding about assessments. I did not learn the extent of the Webster; the Alta Consolidated is 3,000 feet, divided into 20 shares. Like the preceeding two, no one can tell which will win the prize.

## saxox.

My ride with Mr. Beardsley terminated at this claim. It is also just commenced. being only 30 feet deep. It contains 2,400 feet, divided into 15 shares. Mr. Binnex, the Superintendent, is doing splendid work; he is both practical and intelligent. From indications, and beurings of the compass, the Saxon think they will couse on the lode, when they get down 100 feet. I shall go down this shaft some other time. I-am anxious to do so, beeause if they prove correct in their judgement and strike the Copperopoli: lode, in what light are we to regard the splendid lead already developed by the Table Mountain claim, oue fourth of a mile west of the Suxon. and the last in this line before reacling the river.

## wide west.

Parallel with the Saxon, and adjoining the Table Mountain, is the Wide West. It contains 3,000 feet, divided into 20 shares. They calculate to siuk 100 feet, and then drift East about 30 feet as directed by the Table Mountain, of which indeed, it is an extension. At present they are only down a few feet.
table hoentain.
Although I risited this splendid mine on Saturday with Mr. Pike, this is the proper place to notice it, as on the Copperopolis range proper, it is the last clain toward; the river from the town, in the direction I have so far taken. Although last mentioned, for many reasons, it is the first in importance. Table Mountain is between 5 and 6 miles from town, nearly south east, and about one mile from the Stanislaus river. The claim consists of 2,150 , feet in 21 shares. They have two shafts, one 120 , the other 40 feet deep. In the latter they have a magnificent lead 4 feet thick; io the former, they were some thirty feet east of the lead, from this they are now drifting and have about 10 or 12 feet more to go. They are workiug day and uight-employing fourteens bands.
Out of the 40 feet shaft, they took 12 tons of No 1 ore. I sent you two splendid pieces of ore which I took from the bottom of this shaft. Apart from the richness of the lead dereloped in this shaft, it has importance from the fact, that it varies from the direct line of the Union lead taken by Professor Whitney, who invariably places the Saxon on the direct line. What then is the inference? That in instend of one direct copper lode, running through this ralley, there are two, or else the Professor made a mistake of one fourth of a mile, and the Table Mountain, not the Saxon, is on the main lead. Whichever proves true in the end, it is at present of great consequence to the intermediate claims still undeveloped. I have, howerer, something further to say about the Table Mountain. It was a matter of notoriety on Montgomery street, before I left, that the Table Mountain stock was depreciated 15 dollars a foot, having fallen, I think, from 40 to 25 dollars. However this came abont, persoual observation assures me, it was a gross injustice. There is not a better developed lead, at 40 feet feet, in this district, than Table Mountain, and the samples I send down, which I picked off the solid rock, indiscriminately, at the bottom, proves this fact. I mention this truth, ouly in justice to the district; and because the stook being a marketable article, the public at large have a right to know the truth. My opinion is that those who buy this stock at $\$ 40$, bny rery cheaply indeed and lay the foundation of a nice speculation.
These claims I have spoken of however, including only a portion of the Cniou are but a tithe of those in the district. They simply embrace those located on the right of the town, leading to the river. I ans just going out again in the opposite direction with Mr. Lrons a gentlenan frum Mr. Honing3berger's establishnuent, and shall contivue my reports nutil I
have inspected all.
L. H.

Copperopolis, Oct. 15, 1863.

## [From our special Correspondent.] COPPEROPOLIS.

Mr. Editor-My first letter apon the mines of this district embraced those of what I shall call, or the sake of distinguishing them, and making their exact locality more readily understood, the first dirision-that is, those stretching from the town on te right-hand to the river Stanislaus, and supposed to be on the celebrated Copperopolis lode proper.
Since that letter, I have received a continuance of civilities from the residents of this hospitable town, being in fact kept traveling round nearly all the time. Yoar old friend, Mr. S. Johnson, invited me to spend a few days at his place, to inspect the Eureka and Flizabeth Consolidated, the Argentine, and the Hope, all being under his superintendence. I cannot speak to highly of his polite attentions. On my rereturn, I paid a fying visit to the Napoleon, where I was cordially entertained by the new Superintendent, Mr. Steinberger, who allowed me the use of his horse for a coluple of
days, so that I could be more unfettered in my movements. I days, so that I could be more unfettered in my movements. I was in the saddle to-day from eight A. M. to six P. M., and though somewhat fatigued-for I assure you, it is not very agreeable work, going down all these mines, sometimes hy ladder, sometimes by rope, to a depth ranging from 50 to 200 feet-I, nevertheless, remember it is the night on which I must send you another communieation.
The peculiar features of this region, as yon approach it from the plaius, have so recently been elaborately described by the Editor-of the Press, it will be unnecessary for me to say anything more on that head, than that his account was geologically accurate, and that the entire belt, commencing at the Napoleon, and extending to San Domingo, a distance of 25 uiles north, affords a most complete field for scientific investigation. The fact to me most incomprehensible is that this discovery should have been delayed so long, considering the number of men in this State, who have worked in the English and American capper lodes. In every rock and stone, in the gulches or on the bauks, you can observe the copper hue, while in the croppiugs you will everywhere find carbonate of copper, frequently sulphurets, and sometimes native ore. Perhaps, however, it is most wisely ordained, that things are as we find them; that one discovery should follow another in due season, to stimulate the enterprise, and employ the energies of the people. A few years ago it was all gold, now it is all silver and copper; a few years hence, it will be all iron, lead and tin; and, when our necessities force us into further activity, we shall search for the latter metals in this vicinity, and find them in equal abundance.
But I must now give the result of my last week's inspection. The first on my list is the

## massachusetts.

You may remember I told you this was the first I visited. It's discription I delaged because it did not belong to the range or location of those I gare, and because I was convinced on seeing it, that another discovery, as important as the Union was made, and I naturally desired to see the results of a little more work, before I spoke definitely of it's nerits. This mine is situated some six miles south of the town, on a range running barallel with those mentioned already, bearing from them on an air line with the Saxon and Table Mountain, about three miles west. This lode, distinct fron the other, has somewhat peculiar croppings and bears a very strieght course to the river. It contains 4,500 feet divided into 150 shares. There is only one shaft, (prospecting, down about 40 feet. The rock from the commencement has been very pure, and now yields ore sufficently good for shipping. When twenty feet deeper, I think the vein will be twenty feet wide; while for richness, when fully developed, it will equal, if not surpass, the far-fanmed Union and Keystone. Adjoining on the Noith of the Massachusetts comes the
From Copperopolis, the Pacific is the first mine on this renge. I mention it second because at present it has not the same irpportance as its neighbor. There is no reason, however, why it should nat be as good. It contalns, I believe 4,500 feet divided into 30 shares. It will henceforth, I understand, be worked steadily. On the south end of the Massachusetts, going towards the river comes the

## swansea.

This mine ooce reacked so high as to have a local ralue of $\$ 15$ per foot. It's valuation has fallen at present, but simply, in my opinion, from want of judgement or experiencee in
selecting the place to pat the shaft down. For instance this mine, unquestionably valuable, has been worked for a year with no practical results as regards the vein, from this cause alone. The old shaft io feet deep is at last abandoned and a new one commenced under mnch more favorable auspices. I think the present shaft will develope something, though the site is not exactly well chosen. It contains 4,500 feet divided into thinty shares, The work will naw be prosecuted vigorously. Next to the Swansey, and last on this range comes the

## scorpion.

This mine is nearest to the river of any, being almost on it's banks. The same error of judgement has been committed here as at the Swansea, and their shaft, ëxcept for ventilating purposes in future, is entirely useless. They have gone down 120 feet. and intend sinking for two weeks more, although a long way below the vein, wit', an intention of drifting to the east to strike it. In my opinion, this is bad policy. They will have to run a drift at least 40 feet, and through so bard a rock that it will cost as mach nearly as to sink a new shaft in the proper place. The rock hitherto raised carries an inmense quantity of iron, and is generally corrupt: There is no doubt, however, the claim will alfimately be good. It contains 3,500 feet divided into forty shares. This claim is the wetest I have been iuto yet; water is generally very scarce throughout the district. From the river, on the opposite side to Montezuma, a distauce of six niles south, this wonderous copper lead disappears altogether.
1 mast now taka you in an opposite direction, to Mr. Johnson's. You leare town on the Sonora road, and go round some seven milles to get to his place, though really only four miles from town. I enjoyed anyself much with hina, for he's a splendid fell im. We lad long political chats; he is a Union man of the first order. The priacipal claim is the
eurera \& Elizabeta consolidated.
This claim coutans 6,000 feet and is incorporated. The main shaft is down about sixty feet, with good indications. When I was there they had a tremendous boulder on the bottom, but below that, as is often the case, they will fiud, I think, a very favorable change. On the same range comes the
argentem,
In this claim there are 3,000 feet, not incorporated, and 1 believe, principally owned by San Francisco men. The work has been suspended for some time, although the oldest claim on this range, to complete certain preparations, and will soon be renewed. Next and last follows the
ноге.

There are 4,500 feet in this claim, not incorporated. The shaft is $3 \overline{5}$ feet deep through a very hard rock, but of a good character. Water is now appearing which indicates a change All these mines are strongly developed. They lie in a direol line four mil s north-east of Copperopolis. and the water 0 the entire district falls into the Calaveras River, not the Stanislaus. In the croppings, native ore is found. The mai is closing, and I must close. I desire, however, to say mor of this rauge.
I find the Mining \& Scientific Press, is appreciated here and subscribers are coming in. Tomorrow is the Judiciery Election, so I suppose I will get a day's rest.
L. H.

Copperopolis, Cett. 20, 1863.
Pactric quartz Mining Coxpany, Grass Valley.-Gras Valley. Nevada county, has long been famous among Càii fornia mining districts for her rich mines of gold, both it placer and quartz. The Allison Ranch mine is famous th world over, and is generally set down as the richest gold min ever worked. The Messrs. Watt \& Oo., on Massachusett Hill, are working a mine which is probably not at all inferio in value to the Allison Ranch, and only about a mile and half distant. During the past two years a company know as the "Pacific Quartz Mining Co.," have been opening mine, almost directly in the town of Grass Valley, whicl to all present appearances, bids fair to rank fully equal in es tent and yield with either of the two first mentioned. Th mine has been opened to the depth of 300 feet below the be of Deer Creek, which it crosses, and at à depth of 240 feet, gallery has been opened a distance of about 250 feet, the roc from which has proved of a richer average than that take from any lesser depth. This gallery has thoroughly provs the value of the mine. About 2,000 tons of rock bas bet taken from below the water lovel of this mine, which has ar
raged fully $\$ 45$ the ton，constantly improving， with its depth．The hoisting und promin spparatus has hithertu treen driven by a twen $t y$－five horse power engine，which bowever，is now to be supereaeded with one of langer capucity．The stuck of this Uompany is di－ vided inte 60 shares，nune of which to our knowledge has ever clianged hands．In addition to the three already mention d Girass Valloy postesses several thers whit h

THE OWEN'S RIVER REGON AND CANAL COMPANY. It gives us pleasure to notice the vigor which the 0 wen 's Fiver Canal Co. display in the prosecution of their enter prise. Altlough the Company was only incorporated on the 26 th. of last August, a large amount of the stock has been taken, and tools, provisions and camp equipage for thirty mien, have been forwarded, via. Aurora, through which place, they passed some ten days siuce.

We have examiued, at the office of the Company, in this city, the maps and surveys of be Coontry including the map as made by J. E. Clayton, of the line of the Caval, and show ing many of the prominent lodes of the Russ anil Iuyo Districts.
From the best information we can obtain of the character of the mines and the many advantages they possess in the way of cheap facilities fur working, possessed as they soon will be, through this Canal Company, of au u limited supply of water power at a mere nominal rate, this must soon be come an important miniug district.
As the Company proposes to charge only one dollar per stamp, rumniog time, for motivep ower, it will be readily sern and uuderstood that lodes paying not over $\$ 20$ per ton will be worked at a profit, or in other words, ores from all the mines can be worked to as low a grade as $\$ 20$ per ton. There are also other adrantages which this country possesses pver Reese River, Humboldt, Washoe, and Esmeralda, in the large anonnt of agricultural land in the valley of Owen's River, immediately adjoining the mines, and in the superior milluness of the climate, this region being neither so far south as to be burnt and scorched with heat, nor so far north, or so much elevated as to have snow to fall and lie over twelve
bours after falling. Cattle remain in good condition. all the year round in the open felds; and the Winter is the most favorable seasou for work, and freights are taken at lower rates in the Winter by the way of Los Angeles, than at auy otler time of the yeur. Freights can also be taken at all seasons, from Tisalia, at the same rates.
There is now a steady stream of immicrration pooring into the valley, from all quarters. On Tharsiday of this weerk, a rompany of thirty farmers, mechanics and miners. connected with some large capitalists, of this city, leave Brooklyn or San Antonio, across the bay, for Owen's Yalley. We have also beard of several smaller parties recently going forward.

De Bend City and Sau Carlus, the principal settlements in the valley, are being rapidly built up with stone and adube houses of the most substantial cbaracter, white all the indicitions for permanency, show that this country is steadily progressiug.

The people of that district hare never as yet attempted to raise an excitement by newspaper articles, yet it's fame, aud name is being spread abroad, and we look for quite an excitement and rush to Owen's River at all early day.
The Onen's River Caual Enterprise is one of the highest importance to that region, both as regards its mineral and agricaltural development. To the miner it affords cheup and convenient power, aud to the agricaltnralist abundant facilities for inigation where needed. By its cheap power, many mines which could nerer pay the expensés of steam, may be wrought wih profit, and thus give emplogment to thousands of miners, which would not otherwise be brouglit iuto that region, to be fed by the farmers of the ralley.
A small outlay only will be required to put the work in a sufficient state of forwarduess, to get their sawmill in operation, the income from which ought to be nearly if not quite sufficient to construct the balance of the work within a reasonable length of time. As an investment, few schemes presenta more farorable basis and the terms upon which its stock is offered are liberal in the extreme, as will be seen from the Company's advertisement in another column... We feel free to speak of this enterprise as we do from our favorahle personal knowledge of its projectos, frow the information within the reach of any one with regard to the feasible nature of the scheme, and from the fact that the undertaking is one of public interest, as an important initiatory step in the development of a large and valuable region of country, upon the extreme Eastern boarder of our State.

Abour two millions of treasure were received at San Francisco, from the interior, duriug the ten days preceeding the sailing of the last steamer.

IMPORTANT DISCOVERY.
The discovery of a remarkable Salt Spring to the nroth of Virginia City was anounced a short time since. Mors value should be attached to this discovery than it has generally oltained. Salt, apart from its domestic use, is an indispensible requisite to the reduction of the silver ores of the Eastern slope. At first the article was trausported to Virgiuia city in large quautities from this city. Some two years sinco large deposit of mineral salt was discovered in the Walker's River region, from whieh point the reduction works of Wasloe have since been chiefly supplied. This loposit, howerer, is at a great distance from the chief point of con-sumption-some 180 miles - and for the most part over a very rongh and heary road. At a more recent date we have all heard of the wonderful salt deposit between Humboldt and Reese River. .This latter discovery, however, is more remote frem Virginia City than that of Walker's River.
The latest discovery, however, and the one to which we designed, mure particularly to refer, at this time, is located about sixty miles north of Virginia City and sume twelve miles east of the California State line, which latter fact ind. ced the proprietors to name the location the Boundary Line Salt Works. This-discóvery consists of three s,rrings within the circuit of a few feet, the waters from which may be easily connected. The main spring alone yields a regular flow of about ten or twelve inches, miner's measure. The salt held in solution liy the water is equal to a fraction over one half its buik and yields a salt chemically pure-a very important consideration, whether used for ore reduction or culivary pflrposes.
The chief value of this discovery consists in the facility with which it may be delivered in Virginia City and neighborloond, the puint of chicf consumption of the arsicle on the Eastern slope. The spriugs are lucated near the Eastern fout of the Sierra Nevala range, and a fine natural road upou a level alkaline basin may be foumd vearly the whole distanco from the spriags to the Truckee Meadows, from which poiut Virgiuia City is reached over the Tru kee Turnpike.
The proprietors conternplate, the early erection of evaporation rats, when they will be able to lay down a superior article of salt in Virgiuia City at about half the present price of the article in that market, and still leave a large margio of prufit.

## $\left.\begin{array}{l}\text { Lixe House Mising District, } \\ \text { Nevada Co., Our. } 18,1863^{3} .\end{array}\right\}$

Mr. Entror:-I ask a place in your valuable paper for a fer nutes takea during my ramblings through this and adjoining mining distr cts. I find that the exeitement of three munths aco has sumewhat abated, and that the owners of cupper claims, (none . thers are thought of here.) have ceased ruming alter new claims, and have turned their attention nore to develupiug thuse already located; still there are a large number of claims that have been located but never yet prospected and now liable to forfeiture, whilst others have culy done work enounh to secure then. One hundred dullars expended upon a clain will hold it fur two years. Among the claims now being worked, I will mention a ferw. The Houker is being worked with good prospects at the depth of about 90 feet. Stock in this Courpany is sulught after by those best acquaiuted with the claim. "No Chance at All" is being worked with fair prospects; ; also the Manmoth which bids fair to pruve valuable. The
Last Cliance is still at work with an improvement in the Last Cliance is still at work with an improvement in the
appearance of the Ore. They have sacked some but. I believe bave not yet shipped any. The Eureka Consolidated Company, on Ggeen Lead, isa at present taking out very good ore. The rein is increasing in thicknessay have a uuraof tons of first quality ore alreally sacked, and I understand intend to commence seading it off to-morrow, and will continue sacking and shipping as fast as ores are taken from the mines. The still House Lead, on Bear River, is reported good. I hare not yet seen it. The Well Claim is still being wurked with very fattering prospects. After sinking a shaft over 50 feet, ( 49 feet of which was through solid ore, follow ing the east or hanging wall,, they have run a drift or tunnel westward, with th. intention of finding the west wall and thus ascertaining the width of the vein or ledge. This dritt las beeu pushed thruagh a mass of mineral for sixty feet, withuat yet striking the west wall, thus proviug that the vein is at least $G u$ feet wide, with prospects of a sill greater
width. The Company have already shipped aboit 180 tonis of ore, and have a plenty left.' They are now taking out and seuving off ore as fast as tenms can be had to haul it to Lincoln. froin which place it is forwarded by rail-road. :From outward appearance the Conpany are well prepared for a
Winter's work, having a good whim by which they can haul Winter's work, having a good whim by which they can haul all the ore and water out of the mines, with one horse, with ease, and the works are all covered with a good, substantial house to protect them from the rains.
There are a number of other claims in the ricinity on which work is being done-some with very grod prospects' but I must defer further notice of them for some future time. Prospretor.

The Palmo Shuyer Mintmg Company filed their certificate of incorporation on the 17 th. inst. The first Board of Trustees are Edward Tomkins, D. S. Lord, Wm. Faulkne , L. P Fisher and Joseph Fian Doren. Capital Stock, $\$ 240,000$ in 2.4no shares. It is located in the muncipality of Ryan, Ures District, Sonora, Mexico. This mine of silver petauque metal has the reputation of being une of the richest mines in the State of Sonura. It is in the Sierras de la Palma, near the Aroye de li falna, where there is a fine water privelege and Hacienda, with twelve arrastas belonging to the mine; also an abundance of wood and pasturage land.
The mine was once wurked by the Muntezumas and afterwards by the old Jesuits, whose history of the mine, as is seen in their manascripts or Church records, states that the metal pays 100 marcos per balta. or 800 ouvzes of silver to the 900 pounds of ore when worked in the common arrastra or patio process, with the simple use of quicksilver and salt. 'The mine has always been worked in the primitive style of going to the top of the hills, and sinking, and packing out the ore on the backs of the Peons and leaving Pillars which consists of three fuarths of the whole mine. The lower Pillars are in good working order yet, all iu metal. The present Conpany have started a tunnel which will strike the vein below the old works, where they will undoubtedly find the class of metal last obtained from the mine, some thirty years ago, and known as blue petauque or cobre gruisa, the richest class of silver ores.

Nerada and Californa Processes of Silver and Gold Extrac-
tion, by Guido Kustel-Cariton, San Francisco.
It is with considerable satisfaction that we find in this book so much to which we can do inadequate justice this week. 'The material is treated by a writer who has taken to the mine and the mill a spirit of enquiry which was not to be salistied withunt a reply. The result is valuable data for judging of the economy attained, and many suggestions for for guidance in carrying ou the work of improveruent.
The facts in this book will be very valuable to the develpment of the resources of California. There is one point of importance whicls is deserving of the earnest attention of trustees of mining courpanies and mine superintendents. Mr. Kustel writes: "In Germany the roaster works with hands and head, and is responsible for the result. His work can be trusted. Our roasters are inexperienced, frequently, green hands, without the least interest in the result." It may be on this arcount that he depreciates "precipitation
which has been there so eminently successful. I here which has been there so eminently successful. There
"common workmen," says a recent writer, "have attained the facility in perforning it." The problem is to give them such an interest in the success of the particular operation intrusted to each individual as will ensure persevering applicationevery step must be checked, then wanton waste, from carelesso ness, will be prevented.

Poll Tax.-Poll tax it is said must be paid in coin. Greenbacks are not taken by the collectors. The Ophir company at the works in Virginia City, says the Enterprise, tendered the amount of poll tax due from their employees to the Collector in greenbacks, and he refused to receive them. The matter will be fuily tested. The Tax Collector was about to sue the Ophir Company for each and every re ceipt. It is said that the refusal of the Collector to receive greenbacks is founded on decisions given in this Territory, in Califorvia and some of the Eastern States.

Pen Pornts are now manufactured out of the nen metal Alumineun. This metal preferred above any other from the fact that it is not oxydizable.

## THE MINING SHARE MARKET．

The Mining share market，during the past week has ben quite actioe．and not withatanding the udjourument of the toek Buard on Wedmesday，a large amount of husiness has ren transucteal．The recent diepusition on the part of the rrokers to call in aud curtail their luans on mining securitie＇s to had a somewhat depreciating tendency on sume of the adiug shares，while several speculative stueks have mani－ （fted umsal activity and in some instances，an important forovement．
Pphir shares during the past two weeks，have been unusually tive，at materially roduced rates．This depreciation is at－ fibutable，mainly to an inclimation ou the pert of many first hes hollers，to let $\mathrm{g}^{\prime}$ ，their shares with the riew of other in－ fotments．This disposition arises trom the ansiety felt ith regand to the suit with the Burning Moscur，which is bon to have a hearing．
Gould te Curry sales have been light and flu ctuating．The akuess in these shares is attributable to the anticipation of decrense in the next dividund which has been suld．the ant week．for 8140 per fout．If the Octuber divilend is hhter than its immerliate predecessors，the fact will be ow－ y to extraonlinary expeuses，for the receipts from the mine this month will be largor than for any previous mou th ree it was opened．
Burning Moscow has been the chief speculative stock of e past two weeks．Although 1341 shares changed hands ring tlic previous week，this stoek has continued in undi－ nished favor during the past week，with sules reaching 919 ares．
Fillow Jocket has adwancerl $\$ 150$ in consequence of a rorable issue of its suite with the Union．Cunsiderable portance is attached to this decission，inasmuch as it is pposed that it will uffect，to a greater or less extent sev－ 1 other important suits now pending．
Union，Gold Hill，which has been in considerable demand several weeks．at from $\$ 3 \overline{0}$（c）in，suddenly colapsed，the st week，in consequence of losing its suit with the Yelluw cket and is now quoted ut from $\$ 50$＠$\$ 1 \%$ ．
I＇ncle Sam，Gold Ifill，appears to be coming into high fa－ It has suddenly adranced from $\$ 135$（a）$\$ 225$ ．Advi－ 3 Irom the mine are highly favorable as to the future of this im．
Sheba shares which lave been very quite of late，has man stedl a sudden activity．Opening the week at $\$ 70$ they hibonly adranced，nemr the close，to $\$ 160$ ，but fiualy de－ neil to $\$ 227!$ ．A few months since these shares were in Hest in this market at $\$ 420$ to $\$ 500$ ，but for a long time， til within a few days，have beeu dull at $\$ 75 @ \$ 100$ ．It shoen recently ref orted that theyare now taking out from mine better ore than ever belore，and that the vein is in atiug in width．Notwithstanding the＂bore metal，＂ icth 30 abounds in the Sheba，and which fact has been al with tellint affect by the＂bears．＂We feel warranted the belief that the Sheba will yet prove a very rich mine． De sutu has adranced to $\$ t 0$ ．
Baltic，Gold Hill，has fluctuated from 45\％＠，62，closing 357.

## El Dorado is dull at $\$ 70$ ．

Wide West continues to droop，and is heary at $\$ 821$ ， ent assessment of $\$ 25$ included．
C＇tah is a little better，and has sold at $\$ 62$ ．
Real Del Monte sold a few days since at $\$ 470$ ，but is now reely 80 frun．Large amounts of Bullion have been re－ ved in this city recently，from this mine．
Re se River Stocks are attracting attention，but so little yet is known of the real value of the numerous claims red in the market，that operators are somewhat timid in ir parchases．
The Florida is held at $\$ 50,35$ bid．Union．No． 2 is of－ ed at $\$ 60$ ．Diamond，said to be a promising claim，is of－ led at $\$ 20$ ．For James River $\$ 13$ is bid．Oregon is quo－ at $\$ 10$ bid，$\$ 4$ asked．Flora is enquired for at $\$ 15$ ． 5 is offered for Ontario and $\$ 50$ asked．Willow Consoli－ whon is held at $\$ 25$ ．Madison at $\$ 12$ ．Lightner at $\$ 12$ ． fiden Era at \＄15．Austria at \＄12．Marshall is said to be imuch favor，with enquiries at $\$ 40$ ．Mills，Post and hite and Erie are enquired for，the former at $\$ 30$ ，the lat－ at $\$ 25$ ．

Crntral No 2.-This mine, located on the Comstock leage, Virginia City, and the third in order going soutl from the Ophir, consists of 100 feet, instead of 150 , as it is generully set down in the newspapers. The majority interest of this mine has recently passed into the hands of Mr. Geo. C. King, one of early and prosperous miners of Grass Valley. Under Mr. King's management, active operations have recently been commenced. The Company is now taking out fine looking ore from a drift at the depth of 130 leet, while the main shaft, now 150 , is still going down. The Company has made an arrangement with the proprietors of the Latrobe Tunnel, under whick a branch is now being ran from the main direction of that tunnel $w$ infersect the shaft now being sunk on the Central ground. The ground of this Company will be the first on the Comstork lead that will be opened by the Latrobe tunnel, which will strike the vein at a depth of about 4,50 feet. We look for important developments at this mine, at an early day. Mr. K. appears to be one of those men, who never take hold of an enterprise, except to succeed, and we presume his nsual good fortune will attead him in the present instance.

of " Deafuess Practucally Illustrated as to its Nature and
Treatmene" pte
The sulf-adjusiing Arificial Tympanum was irst introduced to the nutice of the profession at the merting of the Medichl Society of l.ondon, ou the 201 h of November, 1883. Au animated discussiou cosued on the reading of the paper, and scyeral membern of the suciely bure testi-
mony to the success of the remedy and the importance of tbe oriyinu discovery.
Mr. Baiker Brown (inember) bore testimony to the SelfAdjusting Arlificial Pyayanum, as be had ubserved the immense bentit a young lady iriend of bis had received
from it. She was in fact, quite deaf, and in a most mis-
 eus-quite like a ulracle. Five more Lentinonials trum
ousembers of the Medical College, New York, aud the principal ehies of Europe. Kearny strcets. Entrunce on Market street.

Mo Mr. Enitor-Huving been nfifited severe cold, aud for the last monih sultering from the nost excrutiating pains in my ear, I wha ubliged to come recomeudatinn to wait on Dr. De Castro, no the corner of Kearsy and Market atreets, and underwent one operation nul it is with the utmont pleasure I can bay my hearing was suddenly and withont paia catirely rentored, 1 deem it iny duty oo mase this known to the bublic, and to re commend Dr. De Castro's akil! ns an auribt. San Fraucinco, July soth, 1863.

> [From the Dasly Alta.]
san Fradeigeo, June 80th., 1868.
Ed'rs Dancy Alta:
Permit me through your widoly circulated journal, to say, that my daughter Sury Ellin, has been alficted with has been a member of the Jeal and Dumb Iustitute since it was organized. On rakiog her to Dr, De Castro, on the corner of Kearney aud Market Sireets, and undorgoing under his direction, two operntinus, slie has heard snuads
very distinctly; and is now, Iam happy testute in a falr very distuncty; and is now, I am happy te stute in a falr
way to get permoneut relief. The result, thus far, is sat-
istactory; and I deem this notice due to Dr. De castro for istactory; and I teem this notice due to Dr. De Castro for
his shill; and would recommend ali pirtiee similarly aff
flicted to give hima trial My dughter has at different times been under the caro of the most skiful physiciuns
and aurists in California, but up to the period of risiting Dr. De Castro, received no benefit.

## REMOVAL.

The Office of the Minisid and Smentifie Press, has heen removed to liombs Nos. athand jo (iovernment Hultse, ce ner of Wisthington and samsone Streels. We have been, short distance from Placerville, to the north, and on the induced to makn this change of lueation, nut unly with the American River. One of the richestehains in this district view of securine mir pom and buther accommotations for the New Fa Dorado, has been tied up in law for nearly a year ourselves, hut chiefly to better accommotate persons hating The case will soon come to trial, however, and the quastion busheres with the oflice. Uur lucation is now central, cass of title so sethed that the work of opening and developing of aceess, and in the direct way of the chief travel of the the mine can nnce more be resumed. The New Yurk Co. city to and from the l'ost Office.

## SALT AND EALT MINES.

One of the facts of scientific interest bronglit to light hy the Sonthern rebellion is the discurery of an important deposit of rock salt of remarkable purity in the island of Petite Anse. in Vermillion Bay, on the Gulf Cuast of Lonisiana. Silt springs had been known on the island from an early period. but no suspicion existec of there being ruck salt near t e surface until the late owner, with the view to improve the flow of water from one of the saline springs, cansed an excavation to be made, when at the depth of oniy finurteen or fifteen fiel from the surface. the laborers struck a bed of white rock salt, which they at first imagized to be ice. 'l'bere was no moisture or brine in the deposit, the salt being cumpact, hard and perfectly dry. It was at once recognized, and has since proved of incalculable adrantage to the Confederates, as well as a source of great wealth to the owner. The above facts. as condensed from an Easteru exchange, should be a matte of great encouragement to the owners of the "Salf Spring," noticed in our last issue as having recently been discovere in the ueighborhood of Virginia City. It was with no littl surprise, when conversing with one of the proprietors of this spring, a few days since, that we leaned that no efforts have been made to seek for the depusit of rock salt from which this spring, of such intensely salt water, must flow, The locality of the ground and other circumstances are such as to lead to a reasonable supposition that a very slight excavation would, undoubtedly, lead to the most valuable deposit of rock salt ever discovered, and that too, at probably a mere moity of the expense which would be required for putting up the necessary wo ks for evaporation, ete., which must otherwise be done to render the spring available.

If our memory serves us, it is now several months since this discovery was anounced, and jet, as we learn from jarties acquainted with the locality, no steps I ave been taken to turn the same to profit. Perhaps the owners are not aware of the prize they bave fouud. It not, it is to be hoped that some enterprising capitalist may step in and torn to profitalile account a discovery, which mnst soon hecome of great importance to that region. The consumption of salt in the aeighborlood of Virginia City, for domestic and chemica purposes, is already very large and must soon become im mense. Its production at so convenient a point ought to oring about a most important reduction in the present price of the article, and lyy so much, will it become a public beneit to the district, besides a large source of reveuue to its for unate owners, whoever they may be.
who hold an extension of this lead, are now cruslting 25 tons of rock per each 24 hours. Their stock is selling in this city at $\$ 150$ per share.
The IIarmon fold and Silver, Mining Co., which is now almost daily gloterl in the stock repurts of this city, is also
claim were Kpnney of IIarmon. Who have worked the claim constantly with arastras since 1853. They have recently sold three-quarters of their interest to San Francisco capitalists, who hare organ sed the present Company, and are now putting up a 15 -stamp mill, to be run in connection witl? a set of Eddy's Flectrical Amalgamators (using Whefler's Pans.) the whole to be in operation about the middle of the present month, and to be driven hy a 25 -horse power engine. They have a 40 -foot shart on their ledge, the rock from which is paying from $\$ 25$ (C) \$30 in the arastras. They are also running a tumnel to the vein, through which ore will be Iaken direct to the mill, Mr. Charles W. Mualthorp is the Superintendent for this Company. This stock first made its appearance in this market. some three or fom wecks since at ahout $\$ 2 \overline{2}$ per foot. Since that time it has been gradually advancing until to-day we quote it at \$52. They have about 250 tons of good pay rock now on the ground, and will continue to increase their supply of ore until the mill starts. The business office of this Company is at room No 11, Atheneum Building, in this city.
The Niagara, north extention of the Now York, is highly poken of. They are soon to have 100 tons of rock crushed as a test of the value of their mine. 'The Dardanelle, west exteution, recently took $\$ 1,300$ from 10 tons of rock crushed at the Poverty Point Mill. The St. Louis is located in the same neighborhood, also the Quartz Mountain with 600 feet of tunnel and the Massasoit, "with 25 tons of rock ont and ready for crushing. The Baltic recently made a trial test of their rock with a result of $\$ 22,50$ per ton. This is one of the most promising Quartz Mining District, in this State.
The New Mecmanic's Institutr. - This new building wa formally opened to the members on W ednesday evening last. Quite a large number were in attendance. We looked i vain, however, for the presence of many who should have heen there to have given their moral and material aid to an enterprise which promises to be of such sital importance to our city and state. : The Library of the Institnte is quite large and well selected, and we doubt not that as the long winter evenings apiroach, this place will be a favorite resort for the mechauics of this city.
A church in Prussia, holding 1000 persons, has been constructed, statues and all, of papier mache.

## COIPER IN ORIEGON.

Dr. Paul d'Ifeirry. a çentleman well known in this city, has placeal in om calinet several tine samples of copper ore from a lead in Juscpline Comenty, Urego , known as the "Queen of lironze." One of these specimens consists of the ordinary yellow sulphurets, the other diffirs materially from any copper ore we have before met with un this coast. It is an antimonial sulphuret of coppler, alud is found in imurense masses, as an watcrop, corming a fine ledre, four feet thick, of sulphurets. The company, which is a private enterprise, under the suprerintendence of Ihr. Heiry, owns, besides the one above described. another, and a parral el ledge, about three hundred fect distant, with a well defined lead of sulphurets, 14 feet thi $k$.

These ledipes mun due enst and west with a perpendicular dip. They are located just above the California State line, and about sixty miles from shipping at Cresent city. The proprictors intend to erect two everberatory furnaces upon their mine, early the ensuing Spring for the purpose of reducing their ore to rergulus. A smelting furnace will subsequently be added in which the regulus will be reduced to ingots, before shipping. The Dr. informs us that an abuudance of most excellent material is found upon the spot for making the firebrick which is necessary for such furnaces. There is every indication that the mines must soon become very valuable. The contemplated experiment of smelting the ore at the mine is quite an interesting one at this time, and we shall watch, with much interest, for further result.

The Refugin Minixg Company.-The mines of this Company are located in the celelrated Jesus Maria, of the Sierra Madre, in the State of Chihuaha, Mexico, and about 250 miles from the port of fruymas. There is a good wagon road two-thirds of this distance, with a pack trail for the other third. Freight for this city costs about $\$ 100$ per ton. A stean engine of sufficiont porver, with a 20 -stamp battery, barrels provissions, tools, etc, went down: on the Oregon, on the 15th. iust. The mill will be running by February. The entire cost ul'this "plant" will be $\$ 20,000$. The mine will soon te in condition for raising a large amount of ore. The ore is argeutiferras, carrying a large value in gold and is very docile in reduction. The Mexican patio process is now in operation at the mine, with a result of ahout $\$ 125$ to the ton. The mine is. under the superintendence of Captain Taylor.
Mining Exchange Board at Stnckton.-A Stockbrokers' Board has heen organized at Stockton on a "new principle." ays in Independen:
Instead of the $v, v \pi$ voc, bids of Stock Boards, the offers of stock and bids will be accomplished through an ingenionsly arranged bulletin board, which will always be lying upon the table in the rooms of the Bnard, the contents of which will be published every morniug in this paper, thereby giving the members wishing to sell, the full benefit of this market.
In the Arctic reginns, where the thermometer is below zero, persons can converse at mure than a mile distant. Dr. Jamieson asserts that he heard every word of a sermon at the distance of two miles.

## REESE RIVIRR CORRESSPONDENCE.

Adstin, Oct. 25, 1853.
Editor of the Press. - Since my last, I have been active in my travels over the mines, and I can see nothing to detract or withdraw from previously expressed opinions; on the contrary I am now more fully convinced of the extent and richness of the mines of this country, than ever, All we want is good practical workmen in our mills. This will take time and experience, for our rock is unlike other ore, and it canuot be expected that men can be found who will at once, under those circumstances, bring out all the metal. We ought not to expect too much. I don ot believe in an onslaught which like the whirlwind will sweep down every effort to reach pefection or success. It is the object of millowners, aud their interest, to do the best within the reach of human efforts, and I doubt not, that in a short tine, complaints will be less frequent.
The mills, with one exception, have been running this week and doing good work, though idle the week before. This exception applies to Austin \&-Duff s Mill. I uuderstand Mr. Austin has sold out his interest in the mill, and bought an interest in a foundry in San Francisco. Report says, he has made his "pile."
The work on the mines is being pushed forward as fast as circumstances will admit.

Big Ceek District.
There is an excitement about Big Creek Ditrict, some 15 miles south of Austin. It has a ten-stamp Mill under completion. The ledges are wide. The district contains a stream of water ruining 'a the arerage, 700 inches of water.
Cañon City, at the mouth of Big Creels Canou, is growing rapidy, and I might here inform abseut owners of city lots that they had better look to their interest by taking actual possession, if they would hold them. Parties hare attempted the juouping process in Anstia, but not to their entire satisfaction, so they have gone down to Cañon City, where thes can play that game to $a$ better advantage. That place, it is universally conceeded, is bound to be a place of importance. It is but three miles further from Jacobville, thau this place, consequently about as accessable to the western markets as Anstin. At Jacobsville on the river and on the overland road, leading to this place, there is a mill in full operation, said to be of the first class. It has been but recently completed, and report speaks favorably of it.
North of Clifton, $31 / 2$ miles, is what is call $d$ San Francisco Cañon, where parties have laid out a city, which they call New York. I understand an order has been given for a mill to be erected in the Spring. For convenience this section is called San Francisco Canon District, to distinguish it from Yankee Blade Section. There are many first class mines there, such as the Lady Adams, Potosi, Scalvonia, Magenta and Muggins. The Lady Adams has an incline over 109 feet. The Ledge is but 12 inches wide, and rich in bromides. It stands in good repute. The Sclavonia has a wide ledge, full seven feet and widening rapidly in its descent. I believe it is a good ledge. The Magenta has a tunnel over 35 feet deep, and has a well defined ledge, and I pronounce it of the first class. The Vingan, still nearer Clifton, is classified with some of the best. I found an incline about 45 feet, ledge 14 iaches wide. Pizaro, on the same slope of the mountain is a well defined ledge, presenting the appearance of several reins grouped together; ledge six feet wide; rock hard requiring blasting.
In the hill over beyond the Tankee Blade has been found a ledge called t e Oronoco, where almost on the surface is found what is called water-line rock, from the fact that heretofore it has been found only when they strike water, in the shaft, and it is an indication of first class rock. This is what all are desirous to find in sinking a shaft, and it immediately establishes the reputation of the mine. What may be expected on this ledge, when they reach water level, it is fair to presume will be gratifying. The rock resembles the Ontario, and assays $\$ 1690$ per ton; ledge six feet wide on the top, and perfectly uniform in quality. The town is growing as if by magic, and the streets crowded with teams and men; presenting for a short distance on Main St., more of a crowded mass of humanity and horse-flesh than on Montgomery Street, in
your city. your city.
The use of the ramrod in drilling troops has been dispensed with in England. The reason of this is, the steel raurod with in England. The reason of this is, the steel raurod
eauses the the woar of the rifed barrel by friction.

## Mokrlcane Hill, Calateras Countr, \} Oct. 10т14., 1863. $\}$

$M_{\text {r. }}$ Edrtor.-In my last I spoke of our Placer \& Quartz Mining, and will now say something of copper, as we have some of that also. And let me tell you that the copper region is not confined to Copperopolis and Campo Seco districts, but is to be foand in various portions of our county. There are those who thiuk it is not to be found in paying quantities outside of the above mentioned districts, but they are the veriest Tyros in the knowledge of copper and copper mining.
Some three years agn I predicted the discovery of copper ore east of Bear Mountans and parallel with the Copperopolis lode, also in the San Domingo district. In each of those places, the prediction has been verified.
In the Sapn Domingo district several good claims are now partialls opened, and promise, ere long, to be among the best in the county. I will mention now but the fullowiag. which are in active operation: the Noble, San Jose, Star, German Hill and Clincher Claims.
The Noble Company has lately erected a steam pumping engine, on their claim, and are now in a fair way of working. T'en thousand dollars have been offered, and refused, for an original interest in this clain.
The German Hill Company has also struck some very fine sulphurets and black oxide, at a depth of thirty feet, in their claim.
The Star Company has struck the same quality of ore as the German Hill, but in greater quantity at the same depth. They have several veins varying fr m four inches to two feet in width, with good shipping ore as it comes from the shaft. The Clinker Company is now getting goud looking rock at a depth of seventy feet, and as it is located between the Star and German Hill claims, no doubt is entertained of strikiog the same quality of ore as those claims are now getting.
There are a great number of other claims in this district, (San Domingo,) but those I have mentioned are the priuciple ones a: present, and I proyose speaking of one district at a time.
Copper mining, to be profitable, most be conducted by skillful workmen, and I am sorry to see so much neglect, or iudifference, manifested by mining companies to this all important fact. I have noticed in a letter from some of your correspondents, statements to the effect that large amounts of money are frequently squandered in useless and unproductive labor upon mines, and that in some cases such mines have received mach positive injury from such misapplied work. I could also meation numerous similar cases were it my business to do so. Now why is this the case? Simply because the Directors of Mining Cumpanies are chosen without any thought as to their qualifications for such a position. A body of men qnalified for mining directors, will be sure to have a competent man as superintendent, and competent superintendents give value to mines, from their systematic working of the same.
Ifear this is already too long, and will close by saying that in my next I will speak of the "dressing " and concen trating of ores; but lest I should differ with your correspondent, J. P., will take time to consider.

> An Old Copper Miner.

Gold Minne in Exgland.-According to the General Summary of Mining Statistics in England for 1862, it appears that only one mine in England made any return of gold for the year 1862. At the present time according to a recent report, there are twenty-four workings named as gold mines. From a report before us of the Directors of the Vigra and Clogan Mining Co., it appears that the Company are working for both gold and copper. At their gold workings they have introduced Mr. Moshiemer's Amalgamating Pans. Six of these pans are now employed at these works. According to the Report before us, these pans have recently been subjected to a working test with another operation, known as Britten's Machines," in which the Mosheimer Pan entirely outstripped its rival.
The Pioneer.-The oldest quartz claim and mill in Nerada Territory is the Pioneer, located in Devil's Gate district. It was worked in 1857, first with rockers, and is still worked, paying $\$ 40$ per ton of rock, and gradually grawing richer in silver. So saje the Enterprise.

## IMPROVED MATERIAL FOR MACHINE BEARINGS.

Experiments have recently been made upon the London and Northwestera, the London, Chatham and Dover, and other railways. with an inplorod material for axle bearings. The alloy used con-ists of iron, copper, tin, and zine, combined with a small quantity of sulphur, and sometimes also of arsenic. Convenient proportions 'are-iron, 2; parts ; copper, 28 parts; tin, 40 parts; ziac, 130 parts; sulphur, $11 / 2$ parts; and arsenic, 1 part. If the arsenic be omitted, the quantity of sulphur should be increased. The proportions may be considerably rartied. In carying out the inveution, it is proposed to take from thirty-two to forty parts of eo per; then from two to seven parts of iron; then from fifteen to twenty parts of tin; then from one to two parts of sulphur; and from nehalf to one part of arsenic, and mix or combine them together in a crucible, or anv other suitable vessel, by first fusing or melting the copper; then add the iron thereto, well mixing them together; then add the sulphur, or the sulphur and arsenic, as the case may be, and again well mix them, afterwards add the tin, stirring the whole well together, and cast into ingots. The inveator does not intend, in all cases, to employ-ulphur in the manufacture; for example, in some cases it may be used as a flux to render the amalganation of the metals or allogs more perfect; in other cases it may be used to render the alloy hard, the quantity of sulphur being raried in the portions above stated, according to circumstances. He also employs the arsenic, either seperately or in conjunction with the sulphur, for the same purpose, as above stated, for the use of sulphur rarying the proportions. He uses these materials to form the first alloy, or hardeving metal, bit the above named quantities may be variedi, to give this alloy the necessiry degree of hardness, according to the purpose for which the improve I materiul or alluy is to be apptied. In the second part of his process he takes from eight to sixteen parts of this alloy, or har lening metal, and melts it in a crucible, or other suitable vessel, and when melted, adds thereto frona seventy-six to one hundred and two parts of the best spelter or zinc: when that is melted and mixed with the alloy or hardening metal, he adds from twelve to eighteen parts of tin; the whole is then well mixed or combined toge her, in order to make the improved materiul or alloy complete; then casts it in the usual manner into the various forms as required. It is proposed to use the alloy as a snbstitute for gun-metal bearings, and as it can be sold at es4 per ton, Mr. Wh. Levett, the present holder of the patent, anticipates that it will be extensively adopted. Froma a trial on the London and Northwestern Railway, extending over seven months, during which time a pair of bearings were worked without renewal, it was found that the improved alloy (surfices equal) lost weight at the rate of $83 / 4$ ozs. per month, whilst the gun-metal beariugs, in the same carraige, lost 20 ozs. per month, and the amount of lubricati in required with the neir alloy was 20 per cent. less than with gub-metal. On the London, Chatham and Dover line, the results of two separate trials, also extending over some time, were even more favorable. Mr. Levett's alloy lost weight at the rate of $73 / 4$ and 61/4 ozs. per month respectively, whili.t the loss with gun-
metal in the same carriages was $161 / 4$ and 16 ozs. respecmetal in the same carriages was $161 / 4$ and 16 ozs. respec-
tively. Fxperiments are likewise being made upon other railways, the results of whicls we shall publish as soon as practicable.-London Mining Journal.

Tre Sheba-The following item, from the Humbolat Kegister, will be interesting in connection with the recent movements in the value of this stock:
"The workmen in the 'Sheba' struck richer mineral, T'uesday night, Oct. 12 tho, than was ever before found in it The ledge varies from four to six feet wide, and is beautifully defined and cased. It is supposed by practical men who had an opportunity of judging, that the men took out ore, Tuesday night, to the value of $\$ 20,000$. This confirms the statement we made last week-that practical men consider "sheba "better wortin $\$ 1,000$ a foot now than it was ever before worth $\$ 500$. Sharpers will be after it, and at the same tima undertake to keep it down. When they have once more got, it in their owns hands, look out for higl figures for 'Sbelia.' Their recent depression of it, and the reasons they quietly circulated for its going down, did much to injure the whole series of silver mines in this county.

## sUgGestions about foreign patents.

American inventors should bear in mind that, as a general ule, any invention which is valuable to the patentee io this country, is worth equally as much in England and some other foreign countries. Four patents-American English,French and Belgian-will secure an inventor exclusive monoply to his discovery among one hundred millions of the most intelligent people io the world.
Models are not required in any European country, bat the most care and experience is necessary in the prepuration of the specifications and drawingse
When parties intend to take ont foreign patents, engravings should not be published until the foreiga applications bave been made.

## ASSAY OF SILVER ORES.

Estimat on of Sileer contained in Lead Ores. Many varieties of lead ore contain silver; consequently we will bare to describe how to assay an ore of lead first. and then describe the method for obtaining the silver, 'I he common ore of lead is Galena; 200 grs of the pulverized ore is nixed with 200 grains of carbonate of soda, the mixture placed in an eurthen crucible, smeared with black lead; into the mixture is inserted two or three ten-penny nails with their heads downwards; upon this is then pla ed ahout 300 graius of salt, and lastly about 200 grains of borax. The crucible and its contents is placed in a small wind lurnace-lieating very gently, until the whole is melted; then gradually increase the heat and keep at a high heat for about five minutes; remove the crucible from the fire and allow it to cool. Break the crucible, and at the bottom you will obtain a button of lead containing all or nearly all of the silver, together with what gold the ore may cuntain. 'The weight of this button, divided by two, will give the percentage of lead. The silver is seperated by the procese of cunsllation; an operation founded on the fact that wheu an alluy of lead and silver is exposed to a current of air, when in a state of fusion, the silver neither gives off perceptable vapors nur becomes sensibly oxydized, whilst the lead rapidly absorbs oxygen and becomes converted into a fasible oxide.

In order therefore to seperate the silver that may be present in buttons obtained by assay, as above, it is only necessary to expose them on some suitable porous medium, to such a temperature as will rapidly oxydize ty e lead. The litharge produced is absorbed by the prorous body on which the assay is supported, and nothing but a small button of silver ultimately remains. These supports or cupels are made of bomeash, slightly moistened with a little watur, and consolidated by being pressed into a mould. Cupellation is conducted in a muffle furnace.

As soon as the muffle has become red hot, six or eight cupels that have been drying in the mouth of the opening are introduced by means of a proper tongs and the bottom of the muffle is covered with a thin layer of bune-ash, in urder to pervent its being attacked in case of any portion of litharge coming in contact with it during the progress of the subsequent operations. The open end of the muflle is nuw closed by means of a proper door, and the cupels are thus rapidly heated to the temperature of the muffe itsulf. When this has been affected the door is remored and into each of the cupels is introduced, by the aid of a slender steel tongs a button of the lead to be assayed. The mouth of the mulle is again closed during a few moments to facilitate the fir sion of the alloy, and on its removal each of the cupels will be found to contain a light metallic globule. in which state the assay is said to be uncovereri. The lead is now quickly converted into litharge, which is absorbed by the cupel, as fast as it is produced, whilst at the sume time there arises a white vapor that fils the muffe, and is gTadually carried of by the door and throngh the openings in the sides and end. When nearly the whole of the lead has been removed, the remaining bead of alloy appears to become agitated by a rapid motion, which seems to make it revulve with great rapidity. At this stage the motion will be observed suddenly to cease, and the button after having for an instant emitted a bright flash of light becomes immorable. This is called the brightning of the assay, and a button of silver now remains on the cupel.

If the cupel was now abruptly removed from the muffle, the metallic globule would be lialile to regetate, by which a portion of the metal may be thrown off, and a certain amount of loss be thereby entailed. To provent this, the crupel in which the assay has brightened should be immediately covered by another, kept red bot for the purpose. The two are now gradually withdrawn together, and after havigg sufficiently cooled, the upper cupel is removed, and the globule of silver detached and weighed.

From the fact that silver liecomes sensi' ly rolatile at very elevated temperatures it becomes necessary to make cupella: tions of this metal at the lowest possible heat at which they can be affected. The temperature leest fitted for this operation is obtained when the mufle is at a full red heat, and vapors which arise from the assays curl gradually away, and are finally remored lyy the traught. When the muffle is heated to whiteness, and the vapors rise to the top of the
arch, the heat is too great; and when, on the contrary, the
fmoncs lie over the bottom and the sides of the ovenings in frmus lie over the bottom and the eides of the openings in the muffle hegin tu darken, either a little more fuel must be added or the draught increased.
If an assay has been properly conducted, the button of sil ver oldained is round, hright and smooth on its upper surface, and beneath should be crystallized and of a aead white color; it is easily removed from the cupel and reailily freed from litharge. The globule is now taken out and flattened on a small steel anvil. The tuel may be either coal or coke, broken into small pieces.
When ores of lead, in addition to silver, contain gold, the button remaining on the cupel is an alluy of tho-e metals. This button is heated with pure nitric acid, when the silver will disolve leaving the gold undisolved; that is: provided the alloy contains two parts of silver to one of gold; if not, the acid will not attack the silver; should this be the case, the alloy, after weighing, is mixed with silver and cupelled with a small quantity of lead, and the resulting button is heated with nitric acid, the gold collected and weighed, and its weight deducted from the weight of the origual button of gold and silver.

## THE MONTE DIABLO MINES,

A large amount of work has been done, the past season, in the way of prospecting and developing the mines upon Monte Diablo. In addition to coal, it is now pretty satisfactorily demonstrated that copper, silver and gold exist, and probably in paying guantities, in that region.
Thuring the past week, we have had an interview with Mr. W. P. Green, who has spent the entire Summer among the mines of Mitchel Canon, (llayton District, and who showerl us indications and evidences that appear quite conclusive as to the value of the mineral deposits on this famous mountain. We examined among others, the following certificates:-
working sample from 4,100 pounds of ore sent dowa from the "Rising Sun Claim," giehled at the rate of s. 42 to the ton in silver and gold at Smith d Co's South Park Reduction Works.
The Guod Will Co.-Six bags of ore weighing 300 pounds, and taken from the surface, yielded at the rate of $\$ 20,10$ to the ton- $\$ 4$, in in gold and $\$ 13,40$ in silver.
Quaker City and Little Giant Consulidated-390 pounds workerl. with a yich per ton of $\$ 25$, (i0, silver and gold. The rock was all from the surface; only eight days work has been done ujon this cluim.
The United Claim-Elephant Ledge-206 pounds of surface rock worked with a yield of $\$ 14.60$ to the ton. A suflicent amount of work only, has been done ou this claim to hold it.
Malnchite-Copper-A small lot of ore from this mine, taken to the Antioch Smelling Works, assayed. 11 per cent., for which the Company paid $\$ 22,50$ per ton. The ore frum this mine can be delivered at the smeltiug works at a cost of sit pur ton for trausportation.

These results speak most encouragingly for the mines of that region. In addition to the companies already enumerated, we would also mention favorably the Garabaldi-copper and silver; Open Sesame, (consolidated,) gold and silver; Great Republic, copper. The Piol eer No. 1, is about hip. ping ore to this city, the first lot of 20 tons paving recently arrived.
The Union, gold, silver and copper, have gone dowe about 60 feet, at which point they have struck a promising rein of ore. The Company is composed of Copperonolis men, who bave become pretty rell posted in copper. Some 200 tun nels and shafts have been commenced in this district, which will be prosecnted as fast as assessments can be levied and collected to carry on the work with.
A meeting of miners of this district was recently held, at Which resolutions were passed to suspend until the 18th. of April next. the rule heretofore adopted requir ng two days work in each month for each 200 feet of ground, in order to bold the same.

## A NEW AND NOVEL PUMP.

Mr. M. Disney, the inventor of a new and norel Pump, has one of his machines in operation at the Golden State Foundry, on First Street, in this city, which all who are interested or curious in such matters are invited to call aud ex-
amine. The principle and construction of this pump are
sach as to admit of its use for a Force and Lift Pump, a Rotary Steam Eurine, or a Hydraulic Water Wheel, For the latter purpose its construction appears to be most adnuirably suited. As a steam eng ne, we imagine its chief defect will be found in the difficulty with regard to its being properly "packed." We presume, however, that further study and experiment might be able to overcome that oljection to a sufficient extent to render it of practical value for eren that use. The chief purpose, however, fur which the machine has been designed is a pump. The une now on exhibition is of two inch size. 1t is the intention of the inven. tion to construct them of all sizes, from one capable of throwing 30 gallons per minute, or less, up to 5,000 . It is impossible to give any idea of its mechnoism without diagrams, I'hose who would like to know more fully of it are invited to call and examine it as above, or on Third, near Broad Street, in Oakland, where another one of the same make may also be seen in operation. The proprietor is prepared to receive orders for their construction of any size. We understand that several have alreally been ordered. County and State rights will be sold on reasouable terms.

## ESMERALDA MINING CORRESPONDHNCE.

Considerable activity has prevailed in the stock market for the past two weeks.
The Del Monte. Pond, Crockett, Western Summit, Lexington, on Last Chance Hill, are all being worked with renewed rigor. About 300 men are engaged on the five claims, working day and night shifts.
The Greenback, Utah, aid Cortez, on Silver Hill, are beng worked by a large force.
The Cortez Company have sunk a new shaft about 30 yards southerly from the old Indianola shaft and are taking: ut more silver rock than has ever been taken from the claim.
A new contract has been given on the Greenback Ledge, and the rock iucreases in richness as the work progresses. Messrs. Lulkin, Lake \& Co. have purchased one-half of the entire mine, ( 400 feet) and are having the rock crushed at their mill. The Company are crushing 45 tons per week. The rock yields on an average $\$ 61$ per ton.
The Juniata Tunnel, on Martinez IIill is now in to a depth of 190 feet. The Company are sinking on the Juniata ledge in the tinnel.
The shaft is now down to a depth of about 140 feet. The ledne is over nine feet wide, and the rock iucreasing in richness.
The Company have about 100 tons of rock out at the mouth of the Tunnel which will be crushad during the coming month at Gregory \& Beldeas Mill.
The Durant Company have purchased a fine Mill which is now being built on Bodie Creek, below the Autelope and Del Monte Mill. The Machinery has nearly all arrived and the mill will be completed and ready to run by the latter part of December
The Durant Ledge is situated on Middle Hill, west of the Strawberry Ledge. The rock is very rich, and the Company are again working the claim with a large force. They have several hundred tons of rock taken ont ready for crushing, at their own mill whea completed,
The Clan Alpine Company are still d.ifting on the claim. The rock is increasing in richness, and the ledge widening out. The upper shaft is down to a depth of 70 feet, and the ledge is four feet wide.

## THE MINING SHARE MARKET.

A bout the usual amount of business has been tsansacted the past week, in th . Mining Share Market. A larger number of shares than usual bave been forced upon the market, which, together with the continued persistence of lenders to call in their loans has exerted an important depreciatory influence upon prices.

Ophir Shares have been unusually active at a large decline. Upwards of 1,000 shares have changed hands during the week. In the matter of its suit against the Burning Moscow, the Company not being ready for trial when the case was called, on Tuesday list, it was dismissed. The Compony, however immediately filed papers for a new suit.
Gould \& Curry shares; owing to a large falling off of its
dividind-from \$150 to \&1un per fout-hus suddealy ned from $\$ 4.600$ (1) \$1.3.30. The receiptas of the Cons-- for the past month have been sumewtint greater than is jrevious like forinal, falling very litue, if ungthime.
 prosecution of their new improvements have been unly lanee, ound will continue sus for a month or two tu 3. Thase improvernents will double the working capacity ('omphaty s mill. She Board of Tru toes have adoptvey commuenduble pulicy in simply dividing their surufter payiner all expeoditures as loy occur.
arning Moscow still continuen the chief speculative stock he market, and has fluctuated from semin (130), cluninge 28.3. There hus beeu a slight fialling off in the extout of actiuns in this stuck from the two grevious weeks.
adison shares have been guite active, and are the only we quote at un adrance uver last week. Their impruvb is attributable to a consulidation with the Burniug con-six feet fur one.
ichigan has been largely dealt in at large fluctuations. ming at $\$ 15$ they nd vanced $\omega \$ 110$ ou 30 days, but tiuatly ad at the original figure.
urnside, ather remaining quiet for a lung period, has again - its appearauce-3yw shares having changed hands ng the week at frum $\$ 8$ @ $\$ 12$.
nele siam, after selling at $\$ 26$ on 30 days, fell to $\$ 200$. elation to the late -trike in this mine. the Territurial Envise of the 22 d ult. says: Wo mentioned yesterday that It strike bad been made in the Uncle sam. Further refrom the mine corroborate all we have said, and make ranin that the late developments in that mine are of o and permanemt value. This is a little further south the rich black sulphuret ores of the Comstock range ever get beenf fomed. Of course the fact of ores of such o having been found in the Uncle San creates a great ing anong those who own feet in clains alljuining and Inward of the spot where these ores are known to exist. holler ohares have been but little in demand, and have prod hands at a slight depreciation.
Orth American has been in considerable demand -455 es having changed hauds at reported rates.

## cert sive.

## ura Nevada opened at $\$ 90$, declined to $\$ 74$, but closed

Nage has declared a dividend of $\$ 30$ per foot out of the learuings of the month. It is conlidently asserted that claim can now be considered a permanent dividend paywroperty.
Wlic shares opened at $\$ 5750$, rose to $\$ 64$ thirty days, closed at $\$ 5750$.
ide of the West, dull at $\$ 30$.
dorado, declined to \$5. brth I?
Davidson, reached $\$ 4$, and closed at $\$ 350$ reton, has a good inarket at \$s.
ide West shares have beeu in considerable demand at quotations.
itelupe, is quoted at $\$ 175$, an advance over last quota-
eba, advanced to $\$ 160$ on early sales, and closed at y, setters. (See notice of this mine in another column.) a Soto is dull at $\$ 30$.
e Excelsior lead, 35 miles east of Aurora, is yielding exnt ore. The Company are about to send two tons to this for a working test. The lode is from 9 to 12 feet wide ys have been made at from $\$ 800$ to $\$ 1,600$ per ton. Sev
ther companies are being worked in the same distric encouraging prospects.
ipments of copper ore still continue to come forward the various shipping mines as usual. The ships Invinand Lizzie Moses are now receiving large amounts is ore for Boston and New York. The former carries rincipally from the Union and Copper Hill mines, and itter from the Napoleon and Newton.

- O Union is now shipping abont 550 tons per month, of
veraging 20 per cent.
e Keystone is not forwarding any ore at present. The minery for concentrating is still in course of completion. He Napoleon has produced for the month of Octaber 360 of ore, varyluz from 11 to 20 per cent in quality.

## THE WIDE WEST MINE．

Fxtract from a private Jetter dated Esmeralda，Octo ber 23， 1863.
Dear Friesp：I take pleasure is giving you some
 the Superintendent，I Lave been permited to go through the works，ad i have carefuily cxamined the condition of the mine，which I find as faverable as could be wish－ ed．The recont yrigress of the work refiects the highest credit on the intelligent aramgement of the Trustees and the gooll and efficient directiou of the Superiutendnnt and Engiveer．A tunnel bas been opebord from the mine to the mill，for the trabsportation of the ore．I look up－ on this as one of the best mines yet opened in the Terri－ tory．The new double ledge is not epened yet，but soon will be，as erery previous preparation is how about com－ pleted．I thuls the sbareholders will soon bear of im－ portant developmente and splendid results，which wil ${ }^{1}$ greatly enhance the price of the strck．I believe the time in near when a thousund dollare per foot will be eonsidered cleap for it．In the mesntime capitulists Will nndoubtedly endea vor to further＇－bear＂he stock； they will tell you there is nc，water to work the mine and，perbaps，that the mine bas given out，but my ad－ vice is tor $\bar{y}$ nu to hold ou to your stock．Believe me When I tell you that I lhink it will be worth $\$ 1,000$ per thare within four months．$K$ ep it，pay your asses a－ ments，and wait with hatience for the rniby season． I am dolng，so far，very well myself．I get many or－ ders；have plenty to do，and raake more mones thain I did in San Francisco．I would be glad to see you come over in the spring and spend a few days with me－I could post you ubout many things whieh would be use－ ful to you．It is surprising to see the miners getting Elong so well．My bent regarda ta my frienda，especially to George．Tell him I have seec Carollac Mejer．She ta earning \＄50 per month．
I wIll write you often，and beg you to let mo hear from you as soon as possibie．

Youra，
Mming Agever．－By reference to our advertislng col－ umns it will be keen，that we have made arrangenente to ob tain special information，through a resident corres－ pondeut，wilh regard to any particulár mine at Reese River．Parties in the city about to invest in＂feet＂ in that neighborhood，and not having time or caring to Incur the expeuse of visiting the locality，will do well to a vail themselves of the opportuaity hereby presented of securing reliabls information，previous to investiment at a moderate cost．
Peranns already holding＂feet＂and desirous to learn through a dixinterested source the actual coudition of the mine in which they may be interested，will do well to embrace the opportunity bere presented of securiag the desired information．
We shall establish agencies similar to the nbore in all the prineipal miving districts，at an early day．

## AN IMPROVED PUMP.

The pump which we have here illustrated is the invention of Capit. (1. II. Ilartison, the whl Mare Ishand I'ilot, of this city, and is designed to throw lawe quantities of water, either as a wrecking or miniog purnp, or for purposes of irrigation. Its principal advantares are that it is lifht, compact, very durahle, and not at all liable to choke or get out of order from any canse. It is sell lulricating and hus neither ralves nor packing, and operates either as a suction or force pump. It can be run fust or slow, according to the necessities of the case, and the quantity of water discharged is in proportion to its speed. When operating as a mere suction punsp, it throws a continuous stream, and is not intermittent,

HARRISON'S ECCENTRIC PUMP
with the water. The grain proved no imperliment whaterer to the most perfect Working of the pump, although it would have at once choked up and rendered entirely unservicable any lilt pump.
In conclusion we would eamestly call the attention of miners and others to this new puиp, which, we can but believe. would prove far more effectual and economical than any other in use for either heary or light, work. Persons desirous $0^{\text {" }}$ satisfying themselves with regard to the capacity and effectiveness of this pump, will receive every facility for so doing by calling upon Capt. Harrison, the iuventor, at 517 Front street, in this city. Capt. H. keeps in constant readiness, as above, a large wrecking pump, capable of discharging from a ship's hold at the rate of 5,000 gallons per minute. He has also a like the common lift pump. It is manufactured of all si-1ing capacity of the Harrison Pump, we have here just the portable engine fully capable of driving it, both of which
zes, from a capacity of throwiug 100 to 5,000 gallons per minute.

In the absence of letters upon the above illustrations, it would be çuite impossible fre us to give anything like an intelligible description of this most valuable invention. Parties desirous of acquanting themselves with the peculiarities and principle of working of this panip, can do so by calling at the place of business of the inventor, at the Phoenix Oil Works, 517 Front street in this city.
The engraving upon the left represents the working arrangements of the pump, which, as will be perceived, consists of a smalier cylinder working upon an eccentric shalt within a larger stationary one. The motion of the inner cylinder is a rolling and not a sliding motion, as is the casp with nearly or quite all other pumps in use, It is, in fact, the motion of an eccentric strap; hence the less liability of this than almost any other pump to wear by friction of gravel, when employed for mining and similar purposes. nicely are all the parts of this pump adjusted, even in those of the lowest calibre, that it might be most effectually used for an air peemp! The engraving on the right represents the pump as clused up and ready for work.

It is a matter of no little surprise, even to the careful observer, that when such vast improvensents have been made and come into general acceptance, in alnost every other department of the machinery of mining, the pump alone, that most essential appendage of almost every important mine, should remain, down to the present day, almost identical in its construction and mode of application to that employed in the earliest infancy of the steam engine, even when no contrivance had been applied to that machine other than a leverage or balance weight to produce the return stroke of the piston. It is true that numerous appliances have been derised for inproring pumps, but none which gave promise of a successful application, on a large scale, for raising water from a great depth; hence we still find the uncient Cornish lift pump at work in mines all over the world.
improvement needed in this pa-ticular department of mining machinery. In addition to the qualities enumerated at the
outset of this article, we have also a most economical application of power, and an ease and smootlmess of working which can never be reached by the most carefully constructed lift pump. There is no jar, not the least irregularity of motion. The inevitable "thug" with which every upward stroke of the lift pump is attended, straining and jarring the machinery in a most dannging manuer, is entirely avoiled in this pump. The great economy in the reduction of space necessary for its operation, is also quite an important item in many cases.
This puinp is not without practice, and we are not obliged to speak of it as a mere expermental machine. One may be seen in operation at the Centerville Salt works, in Alameda county, which has been in constant operation for nearly 12 months as a suction pump, throwing 600 gallons per minuie, rumning at a very slow motion. There is another at work in a mine in Mexico, raising a column of water 200 feet. Another was recently employed in pumping coal and grit from a stranded ship in Bellingham Bay, for three months. The same identical punp, without any repairs whatever, was taken to the late Fair at Sacramento, when it worked quite as well as though it had never been used before. Thousands who saw its performance at that city can unite with us in the fullest testimonial as to its capacity rad effectiveness.
A small size 2 -inch pump was recently employed for about two months in a gravel pit, at the North Beacli Woolen Mills, in this city, with scarcely the least perceptible wear. although constantly discharging. sand and gravel, during the entire period, until the work in haud had been completed. Many of the residents of this city will recollect the employment of one of these pumps (a 4-inch one) some six or eight months since in pumping out the wheat-loaded ship Shawmut, which had knocked a hole in her bottom on one mile rock. Tho bags of wheat had bristeif so that the
can be put in rearliness for working and transported to any part of the city or Biny at the shortest notice. He has also smaller pumps for the same pur, oses.

## THE VIRGINIA SALT SPRING ONCE MORIE.

Editor Mining Press:- In your last issue you expressed considerable surprise that no measures had been taken to turn to profitable account the recent Salt Spring discovery, a short distance north of Virginia City, and intimated that it might 1 e possible the proprietors were not aware of the "value of the prize they had found." Being myself the discoverer of the spring alluded to, and still owning a controlling interest in the same, I would take this opportumty to say that the "proprietors" are fully aware that they bave made a valuable discovery, and are anxious to turn the same to "profitable account." Linfortmately, however, we are like most other California prospectors, not blessed with the means to go on and develop the diecovery by the erection of suitable works for evaporati $n$, or to provide the transportation required to deliver our salt at even its nearest market. If some of your numerous readers, or some others of the enterprising capitalists of San Francisco, or elsewhere, are disposed to take hold of the enterprise, they will meet with favoralile prupositions lyy calling at the New England Iotel, on Sansome street. We are perfectly aware that we have made a discovery quite sufficient to make not only onrselves rich, but any two or three others who may be willing to furnish the neressary capital to start the enterprise.
If, as you intimate, a reposit of mineral salt could be dereloped, at a small expense, the enterprise would prove still more valuable, in fact, of almost incalculable value; for even if a process of evaporation should be required, the facilities for transportation are so much more favorable than from any other salt locality, that we could lay down the article at Virginia City at just about half the cost at which it can be furDisher from any other point.
Please excuse the liberty $Y$ have taken in thus addressing you, for publication. Knowing the interest whieh you talke in all matters pritaining to the developments of the mineral comes of the Pacific Coast, I have takep the liberty to name and addre s is herewith onclosed. Yours, truly,

BUBBLE MLNING AND HOW TO AVO．D IT．
The recent developments concerning the Siantiago，Dauey and several other mines of lesser note，are teaching a lesson which will not be without profit to all reflecting perple en－ gaged in mining eaterprises of any character．These devel－ opusents could not have occurred more opportune．That they will be productive of heneficial results we fully believe， and it is a matter of no small congratulation that the cost of the lessnn has fatlen chiefly upon shoulders abundantly broad to bear the burthen．
it may be that legitimate enterprise will suffer to a great extent in consequence；but it should be borne in mind，that had turther delay have been made，the consequences would have been far more wide spread and ruinous．Not a doubt can be eotertained that numerous similar speculations have for a long time been in process of＂couking，＂and these timely dencut ments will undonbtedly have the effect to nip many an＂op－ eration＂in its incipiency．and for a time．at least，prevent the attempting of any new schemes of similar character．
Such are the present facilities fur the formation of joint－ stock companies，and so great has been，of late，the desire for this class of investment，that it is carcely possible that the two or three bubbles which have already burst can be all that have been swimming in emptiness i，pon the ocean of speculation with which we are surrounded．Our faith i，hu－ man nature is too weak to discredit the idea that we have not in our midst yet other unscrupulous adventurers，who have been taking gavantage of these favoring circumstances to devise schemes for filling their owa pockets at the expense of others．When we consider how simple the process and how considerable the object to be gained，we need not won－ der that，among California operators，men are found ready and wiling to embark in such promising enterprises．

The first step in a scheme of this kind is to select a vein Where at least a small quantity of gold，silver or copper can be obtained，and it near a prosperous concern all the better．

Two or three flaming reports of surtace indications，or early developments，are then spread abroad through the newspapers，alter which a＂Company＂is urganised．A sec－ retary is now obtained，who，with the promise of a perma－ nent appointment and a liberal bonus，is willing to be made a tool in the villainous scheme．A majority of the directors are either lured into it by paid up shares or liberal fees，or they are selected for the facility with which they may be controlled by the schemers．A superintendent is next sought out，who will be swift to do the bidding of his employers．Now follows the farce of a development．An ＂incline，＂perhaps，is commenced，and extendel downward a hondred feet or so ；a small quantity of ore is taken out，and salled，perhaps with gold or silver，or perchance with rich ore bought or stulen from another mine．The ore thus ＂cooked＂is taken to some mill of establisheā reputation， crushed，and a certificate of the extraordinary yield taken for publication and for private circulation．If the scheme is a large one，this operation is repeated two or three times．Its cost is comparatively nothing，as the proceeds go baciz into the hands of the sthemers．The stock is now put into the market，the＂extraordinary＂results advertised and editorial－ ised in all the leading dailies；shares are eagerly sought for and reported in great damand，as they really are Hvery－ thing looks fair and promising．Even an expert，who may be permitted to visit the m ne，if not especially on his guard， will be deceived by the plausible reports from the mill into really believing that the worthless rock before him is a val uable ore．This may all the more readily ocsur from the fact that but very little difference can ordinarily be seen by even the practiced eye，between rock that will barely pay the expense of crushing，and that which will pay a handsome profit over both milling and mining．Under the exciternent the projectors sell out to their dupes，and the swiudle is ac－ complished ere the first dishovest act is detected．

But，it will be asked，how are the public to distinguish be－ tween a legitimate and profitable enterprise and one of these swindling schemes．First，no man should invest a dollar in any
mining enterprise until he has previously ascertained that the directors and superiutendeuts are men of acknowledged standing for honesty and probity．While it is admitted that mining enterprise，in this State，may hăve attracted more than its average of unreliable or absolutely dishonest men， $t$ is not right，or at all warrautable，to assert that canitalists
who are willing or desirous to invest in such operations，can－
not find a fair amount of honest operators，even in this branch／few rods in width．This gulch is occupied exelusively hy of husiness，with whom to entrust their rentures．ALning Mexicans，from 400 to 500 in number．The only person of diricturs，superintendents and secretaries，should be men of high character．who should be cousidered respousible to so－ ciety，if not to the culurts，for the corr ctuess of their reports and the rectitude of their action in their respective spheres． Ligilimate mining enterpris s will never succeed，in this or any other country，except under such management．Let men of means reluse to inrest a dollar iv any enterprise that is not in the hands of managers who have a standing in the community．Such a course will do more than anything else to expose and keep down the hollow and worthless schemes which，under other circumstances，will always be concocted to d lude the incautions or inexperienced．
It is dangerous to the commnity，and disastrous to the business，to countenance in such positio $s$ men who have proven themselves dishonest or who are recoguizied only as shrewd schemers．Whoever buys mining stoek controlled by such men．may calculate the cha ces as more than even that they will be in some way＂roped in＂or＂swindled．＂We fully endorse the advice of an evening cotemporary who re－ marks that＂suspicrous chara ters must be expelled from the directory of all mines that expect to gain legitimate standing． No man should put money in any mine unless lie has good reason to know that the management is in honest and com－ petent hands．Above all，no one should risk all he has in any mining enterprise，for at best it is very much of a lattery．＂
The idea is not a bad one which has recently been hroached in the city of London，to counteract the very evil of which we are writing，and which has recently assumed quite an im－ portance even in that old established headquarters of En－ glish mining．Several leading mining men are there moving in the matter of the organization of an association，which shall act as a medium of communication between men who are seeking mining investments，and through which any man desiring tu invest may ascertain the character and standing of the meu who control the various companies ；the society to have its headquarters at London，with branches through－ out all the mining localities．Much good is predicted from the inflnence and working of such an organization．We are not yet fully advised of the details of the plan．Should anything definite be arrived at we shall lay it before our readers．

## A NOTHER HUMBUG EXFOSED！ <br> The San Francisco（Colorada）Placer Mines a Myth．

By the Brother Jonathan，which reached this port on Friday week，arrived several persons returning from the new San Francisco diggins－so called－about the extra－ ordinary richness of which so much has been said of late． We have obtained the information，which we subjoin，from Mr．Robert Hamilton，of this city，a gentleman of the most unimpeachalle veracity．Mr．H．spent two weeks in the diggings，visiting both the Walker s and Wenver＇s diggings， conversing with great numbers of miners，or rather，prospec－ tors，for there is no mining，worth the name，going on there． He and his partaer，in the course of their prospecting，sunk at least 25 holes to the bed rock，and，in no one instance， found anylhing more than the mere color；nothing which in－ dicated anything more than fair sluice diggings，when plenty of water could be had at a reasonable price．He returned from the diggings，as far as Le Pas，with twelve others，all experienced prospectors from Boise River，each of whom agrees with himself in pronouncing the mines the most un－ mitigated humbug which has ever been started in California！ Several of the company had been in the mines since last July，and all the gold brought away by the entire party be－ lunged to one man，and consisted of a nugget worth about $\$ 250$ which was taken，by him，from a claim belonging to a company，one of the members of which was a friend of his． This man syent some two days on the claim，and was allowed to crerice on his own account，which he did．All ho ob－ tained for this labor was the $\$ 250$ nugget．This is the only claim in all that region which has yet been found to pay expenses to a．white man！Mr．Hamilton has given us a full and as particular a description of the mines and the route thither as could be obtained in so brief a time：－two weeks－which he thinks is quite sufficient to learn all that will ever be profitable to any one of that country．＂He spent the first week in October in and abont the Weaver＇s dig－ gings，and the subsequent week in Walker＇s diggings，a bout
forty－five wiles distant．The entire ground comprised by the forty－five miles listant．The entire ground comprised by the
former is a stall gulch，some two or three miles long by a
any other nationality among them was a blacksmith，who sapported himself by plying his trade at sharpening picks． The bed of this gulch is covered with boulders，among which is a little gravel．It requires three men coustantly at work to get gravel euough for one mar to pan uat！All the water for panning was obtained by sinking holes to the bed rock． There is not a single rocker at work in either Walker or Weaver＇s diggings，nur was there valer enongh in eilher place to wro one while he was there－nor had there been since the diggings were discovered，so far as he could learn． He saw a large number of rockers in the possesion of miners along Antelope Creek，packed there with the expectation of asing then，but he never saw one which had ever been put， together for use！The only place where it weuld have been possible to work a rocker at all was where the trail first strikes Antelope Creek，and where，within the space of less than half a mile，some twenty Mexicans were at work with pitns－barely paying expeuses．The prospects were so poor that no Califurnian，alter prospecting，ever thought of stop－ ping there．At this point was nearly all the water，except that obtained by digging，which was to be found in the en－ tire region for lifty miles arvund．There was so little here， that the twenty Mexicans at．work with pans rendered it so muddy that it was with $d$ fficulty the mules could be forced to drink from it！
From this point for about forty－five miles up the dry bed of Autelope Creek，and the gulches emptying into it，from the hills on either side，our informant and his partner prospected， and met numerous other prospecting parties，not one of whom had ever found a place which they considered of suf－ ficieut value to locate and wait for the rains，even if they had been sure of their coming within a few weeks．
At the northern extremity of this forty－five miles of dry creek bed，is a sort of ravine or gulch，where the creek－when it is a creek－appears to have its rise．This ravine is some five or six miles lung，with an average of a few rods in width．Along this ravine were scattered a few claims which had heen prospected and were thought of sufficient value to locate．The owners were among the first comers，and each claim had some person stopping upon it and holdi $g$ it for the benefit of the company，the most of whom were out in the mountains prospecting．Only one claim of the entire num－ ber was being worked，and that by tho men with a pren！ Our informant said he did not know what it was paying，but considered it doubtful if they were any more than making expenses．In the course of his prospecting，he found ser－ eral places which be thought might pay with a sluice and good head of water．The prospect of water there was con－ sidered very doubtful by all．Nothing definite could be ob－ tained with regard to the rains from any person，The gen－ eral impression was that some time during the winter they would get a little rain，but probably not more than enough to work much except while it was raining．Neither the general features of the country or the bed of the creek presented indications of anything more．Our informant pronounces the reports of dry digging by crevicing，hlowing，winnowing，etc．， of which we have heard so much，without any foundation， whatever，except in one solitary instance．
Just at the lower point of the mountain range which sep－ arates Walker＇s from Weaver＇s diggings，and a mile or two from where the trail strikes the Antelope Creek，as already described，are two claims，each comprising about one－half of an acre of ground．These claims are located on the top of the hill or mountain some 300 feet above the bed of the creek．One of them hardly pays＂grub．＂From the other there has undoubtedly been a large amount of gold taken ； all coarse gold，in pieces，none less than two－bits in value， and from that up to $\$ 150$ ．Onr informant has seen one worth about the latter sum，and numerous others from one dollar in value up to $\$ 100$ ．This claim，which is worked by crevicing，was taken up by two Frenchmen．Its value soon became known，and the report that the Frenchmen car－ ried a large amount of gold about their persons tempted a couple of Mexicans to attempt a robbery．One of the part－ ners was attacked and mortally wouuded．He killed one of his assailants as he lay upon the ground in his death agony；the other fled without getting any of the treasure．The surviv－ ing partner soon alter sold out the claim for five luundied dollars－there appears to be no doubt abont the amount
－took an escort of twelpe men，and started with his own
and his partuer's grold for Ta Pas. Our infurmant mot the party uluut half way on their ruad as he was goinge to the
 tould it large sum sunt. however. The claim was, undubbedly, pretty weil workied vut befire he sulal.
How the cold was d"possited in this clain is a msatery to Ell who have examinel the lecality. It is sung thand waterworn. and a lomir distance from the creek. Nut the color of gell is fomed fur mome that at mile around, exeept on this the litle place an the top of that hill.
The entire region for latl aniln's is heing thoroughly prospertend. but. at the time of our inforgant is leaving, without resulting in timbing anything of salue. 'This last gramil hom, buy has doubthis hecei gotion up for speculative purposes, by a few copplier mine undars mar Le Pats to attract work men to that lucality, and a firryman or two on the C'olurado. The affair hat simee been stimutated and the chat kops up mainly by a few Jew traders at lat I'as, who hud loeen inducend hy the first repurts to take guonds to that locality. The Nin lirancisco mines may be set duwn as a noost arraut owindle.

## MEXICO-HER TRANE AND MINES.

The rapidly increasing trade hetween this city and the varions ports on the gulf of Califormia, has induced the steamship uwners, Messers. Holladiy of Co., to place the Steamer Panama in the line, and we shall now have regular departures of stmmers semi-monthly, for the ports of Mazatlan, La Pas, and Guaymas. The Steamer Panama cleared for thes ports on Thursday last, with a full freight of passengersand merchandise, in luding large quantities of machinery, tools. etc., for the various silver mines now being energetically worked in Lower Californin and Sonora. Among the passeagers were many miners from the Washoe and Esmeralda districts, who having made a $p$ ospectiug trip to the Mexican mines, are now retnrning with a conviction that a field for labor and profit is opened in that section of country far surpissing anything offered in more northern latitudes. The inlucements held out by the Mexican Government for the enlistment of $\Delta$ werican enterprise in the matter of work ing the mines of that conntry are certainly very great, especially as so many well known and exceediugly rich mines partially opened, but abandoned for the want of necessary capital to work the same. are to be obtained by a compliance with the Mexican mining laws, which are very liberal in this matter. Others of equal value, and being worked by the rude and primitive style of Mexicaus, are to be obtained by a fair and equitable arrangement with the owners thereof who are very ready to dispose of their mines to Allerican companies, providing the necessary capital is emploged in the development and working thereof.

The port of La Pas. Lower Califurbia, is open for the shipment of ores free, and all mining tools and machinery are admitted free of duty. Miners are not taxed, and the influx of Americans is hailed with delight. The climate is not excelled in any other part of the world; the weather in Lower California, especially, never being either too cool or too hot.

A large number of mines in Lower Californ'a and Sonora are now being successfully worked by San Francisco com-
panies, anong which may be mentioned the "Pena," "Tr unfo," "La Ilarroonena," "San Antonio," "Gobernadora, "Ophir." " Cudicia." and others on tire Peninsula; and the "Palma" and others in Sonora. The Palua mine has more recently been taken possession of by its present owners, but from indications presented by the large shipment of tools,
etc., on the steauer Pamama, we are led to beliere that the company intend to work the mine, which has a very favorable history, with the greatest vigor. The "Iriunfo" Company, we learn, have nearly completed their mill, at an expenditure of some forty thousind dollars. The "Marronena" Company bave out a large amount of rich ore, which they intend shipping to Englan! carly in the coming season. Several of
the other compauies, we are informed, also intend shipping their ore to England as being the most judicious move at present, the transportation to ship being only 18 miles from the mines. The "Palma" Company (Sonora) will erect works near their mine, which can be done at comparatively suall expense, as they liave an abuadance of water power
near by.
From information which we have gained relative to the mining interest in Mexico, we are induced to form the most favorable opinions The fact is indisputable that Mexico is a silver bearing country-that Government titles are given
to no mines in that country, except on information satisfactory to the Government that the mines are good. When a title is obtained by regular denouncensent or purchase, it can be relied on as safe a d secure, being protected by the Governameut. Nu rerulutions in Mexico over have or ever will effect own legitimate channel ; and private titles obtained from the
(inwormment will he equally respected by uny power which, perchance, may is the luture have pusmanon thare.
We have not time to emtargen on the subje of the mining intersal in Mexico in this number, but will, in some future
number, have mure to say on this great and growing subjuet

## THE MINING SHARE MARKET.

The mining share market has been much excited during the week hy exciting reports with regard tu thee management, of rather misamagement, of the officers of $t$ wo or three corporations ; notwithatanding which, about the usual amount of busithres has been transacted.

Ophir have been the clief speculative shares. They eommenced the week at \$1,425, and gradutly declined to sl, 130 , seller 30 days, on the announcement of a dividend of 1 instetd of 48 per fuot. Near the cluse of the wrek, a
lographic dispatch was received alographic dispatch was received of a rich diseovery
in the nort ern purtion of the mine, upon the strencth of which the stock was caried up to $\approx 1,6 \overline{0} 0$ on 90 days, hut finally clused at Slatin, with a weak market. The sules for the week reached the number of 1482 shares, a laryer business in this stuck than ever before reported for the same period.
Burning Moscow continues much in fayor with speculators. The shares advanced materially on receipt of intelligence of an injunction against the Uphir, but receded to about previous firures on advices that an application to modify the injunction had been refusend

Nu other especial features have been ohservable in the market during the week. We reler to our report of stock bids and sales.

GALEB FOR THE WEEK ENDING NOV. $2,1863$.

Discorery of a Shiper Mine on Lake StPERIOR. - I here is considerable excitement at the East connected with the Lake superior trade, in consequence of the discovery of an
immense depusit of silver beariug lead in that immense depusit of silver beariug lear in that this new discovery. It is stated that the ore yields 20 per cent. of pure lead, and that every ton of lead yields 25 pounds of silver, worth $\$ 300$, besides the value of the lead. Operations will be commenced er long for "removing the deposits.
Cheap Postagr.- - As might be expected the establishing of a unifurm rate of letter postage throughout the United States bas had the effeet to greatly augment correspondence between the Atlantic and Pacific States. For example; says the Alla, there has been an increwse of 25,000 letters via the Overland Mail route since the new law weat into effect on the 1st day of July last.
True largest water wheel in t'e world is about five miles from Douglass, on the Isle of Man. Its diameter is 72 feet, width 5 leet, has 168 buckets 19 inches deep, each holding 9 gallons. It exerts the power of 120 horses, and raises water and coal 484 yards. The axle-centre and crauk weighs 33 tons, and the wheel performs four revolutions per minute with the buckets but half filled. It takes two quarts of oil per day to keep it rubuing smoothly. The cost of the wheel was $£ 3,000$ or nearly $\$ 15,000$.

An Eagle's Fligitr. - It has been ascertained by a traveler in the Grisons, Switzerland, than an eagle flew in his sight five miles in five minutes.

Minhg Agryor.-By reference to our advertising columns it will be seen, that we have made arrangements tu obtain spccial inffrmation, through a resident currespondent, with resard to any particular mine at Reese River. Parties in the city nbout to invest in "feet" in that neighborhood, and not having time or arring to incur tbe expeuse of visiting the locality, will do well to a vail themselves of the opportunity bereby presented of securing reliable information, previous to iuvestineat,
at a moderate cos.
Porsnns nirendy holdiug st fent \& and desirous to learn through a driutterested source the actual condition of the mine is which ther may be interested, will do weil to embrace the opportuilis here presented of securing the desired informaition.
We shall establisb agencies similar to the abnve in all the principal miving districts, at at early day.

ROCK DRILLING BY MACHINERY.
The proluction of a reliable and practical Rock Drilling Machine has long been cousidered a must important deside roum. Even in the Atlantic states the demand for a ma chine of this description in running railroad funnels, in removing ledges, in the process of grading railroads, etc., ha long been urgent, and has prompted numerous inventons to try their ingenuity in this direction. Attempts have been made to devise nachines for boring out the entire diameter of the tunnel hy ingeuioasly derised cutting instruments, but without achieving any practical success. Other attempt have been made to work smaller bnrers, on similar plans, so as to reduce the ledge or face of the tomnel to a honeycomb condition, in which it could readily be knocked away hy hammers, etc. All these experiments have proved failures at the expense of enormous sume of money, from the fact that too much was attempted, and quarrymen, miners and others interested had pretty much settled down into the conviction that, while alniost or quite every branch of human labor might be aided more or less by machinery, the common hand or churn drill would have to continue to all time as the only method by which men could work their way into the solid rocks which comprise such a vast proportion of our mundane sphere.
It was just at this point, however, that a couple of ingenious Yankees concluded "it would never do to give it up so," and resolved, each unknown to the other, that if a whole loaf was unatainable, a half of one might be better than n loaf at all; so they each set their wits to work to devise som method for drilling the holes merely, still employing gunpow der, as heretofore, as the chief agent, for removing the rock The idea was a most happy one, for really the chief labor lay in this very work of drilling-the act of removing the rock by powder, was a small work after the hole was drilled The wear and tear of metal-the friction and resistancenecessary to be overcome to chip away all, or neanly all the rock in small pieces was quite too much to render any such machinery of any practical value. Well, as we have already said, our two ingenious Yankees went to work and as good luck would have it, the one pitched upon the "churn drill," while the other took the "hand drill," as his starting point

After some two or three years of careful study "and experimeat each has brought out what appears to be a most eminently practicul machine for rock drilling-the one operating on the principal of the "churn drill" and the other on the "hand drill." The names of these two inventors, who we feel fully convinced have brought out a machine which wil soon be acknowledged as of immense practical value to Cali fornia, are Williab W. Dunn, who may be found at No Front street, and Mr. J. S. French, who may be found a the Miner's Foundry, on the same street, in this $c$ ty.
By oue of either of these machines one man may do the work of at least four men in the ordinary way. Mr. Dunn machne, which operates on the prin iple of the "churn drill,' has already been put to practical test in this State, and cer tificates of its practibility may be seen as well as the machine itself in operation at his shop, as above. Mr. French's ma hine operates precisely like the ordinery hand drill the
blow being giveu by a hanmer, which strikes upon the drill as in ordinary hand use. We shall have more to sny of these machines at a future time. In the mean time we would advise all interested in tunnelling operations to call and examine them, as ahove, and judge for themselves of their practical and comparative merits.

## EL PASO MINES.

Onr II Paso Correspondent, "C. W. T.," writes us that the excitement in that neighborhoood with regard to the 11 w placer diggings two or three hundred miles to the east o that locality, has drawn away the chief purtion of thei hired help,' and that the mino proprietors there are left to carry forward their proj cts us best they can without heip He thinks the mines of that neighborlood will have to lie ide until the "tide turns." Our correspondent has probably e e this witnessed a pretty strong flow of the return tide from which Twe presume our El Paso friends will derive some ain in the way of an abundance of labor at a fair rate.
Our correspondent further writes that "a lot of splendid ore goes up this week (Oct. 22nd.) from the Yarbrough Com pany, but their work has closed for a time, and the Super:n tendent is now going to hearlynarters to make a new start The frame work of Messrs. Narbroe's arastras has arrived and in a few days they will see what they can obtuin fiom the Rochester gold lead. Our bopes of El Paso are as strong as ever, but we must wait patiently and bide our ime."

Time San Francisco Directory for the year commencing October, 1863. Mr. H. G. Langly, the compiler of the above vork, has favored us with a cony, and we esteem it as no ordinary favor. The book is fall of valuable information touching every leading interest of our city, and should be in the hands of every busiuess man. The Directory proper contains 455 pages-in addition to which are 131 pages of advertisements made up from the principal business houses of the city. A large, well executed and very full and correct map of the city accompanies the work. The book is from the Press of Town \& Bacou, and is a highly creditable speci raen of that class of work. We truas the enterprising pro prietor will be amply repaid for his well applied industry.

Mar of Eu Paso.-We have received from Mr. W. Holt the publisher, at. 305 Montgomery street, a copy of a New Map of El Paso Mining District. - The map embraces the localities of Grape Vine City, El Paso City, Ophir City and the Laurel Hill Mining Districts, All the principal mines throughout a range of count y 25 miles long by 12 broad are distinctly laid down, together with a very distinct representation of the topography of the region. The map is for sale by Mr. Holt.

Copper Ingots.-The United States Mining Fiegister published at Philadelphia, in its issue of October 10th., says that conper which in the ingot was quoted that day at thirty two cents per pound, showing an adrance of a fraction ove

Gold Mining near Plaferville-Correction--In our notice of aininy operations at Porerty Point, near Placerville, in our issue of the $2 n d$. ult. we were mistaken, with regard to the New El Dorado Co. We remarked that the operatiuns of this company " had been tied up in law for nearly a year." A note from one of the proprietors corrects us as follows:-
"The Company owns four different claims. The one on which work has been suspended is claim No. 3., but the principle one, and by far the richest and most extensive, situated on Clay Hill, near Big Cannon, has been and still is being worked regularly, by the Company, Its prospects are very flattering. It contains four different ledges respectively called, from the color of the sarface rock, yellow, white, black and red. A shaft 55 feet deep has been sunk on the red lead, which at that depth presents a solid body of quartz six feet wide, rich in gold uniformly diffused through the rock. The White and Yellow leads have been opened by large eats, and several hundred tons of rock extracted therefrom, which prospects well. A tunnel has been for sometime in progress which is to cut each of these four vains at right angles. The indications are that very rich rock will be struck in this tunnel, which will reach the furtherest lend at the depth of ahout 150 feet from the surface. A mill will be erected near the month of the tunnel. The location of these lodes is all that could be desired. being near the floursbing town of Placerville, with an abundance of wood and water convenient. The Harmon lead runs parallel to the veins bove mentioned.
The Mechanics' Institute Fair.-At a recent meetiag eld at the Mechanics' Institute, the subject of holding, an Industrial Fair by that Association next September, was freely discussed. Several of the officers and prominent members took part in the discussion, and stated that from careful investigation they were satisfied that a Fair held by the Institution next September would not only be a pecuniary success; but would tend greatly to stimulate the mechanical interests of the State. The matter was referred to the officers of the Institute, to take initiatory steps in securing private, municipal, or State aid in furtherance of the project, and to report the same to a meeting of the members, to be held on the 20 th instant. We trust the project will succeed.

Our Home Minlas--The Euburban Mning Company, $10^{-}$ cated near the Mission in this city, has levied an assessment of olle dollar per share, for the purpose of re-commenciug work on their tuanel. We understand that the prospects of the company are highly encourag ug, and that it is the intention of the Directors to prosecute the work of developing their ledge with vigor.
The Gord Hill News is the title of a neat and ably onducted daily paper, which has recently been started at Gold Hill. near Virginia City. We recognise in the name of one of its proprietors, $\varepsilon$ friend of other days, when the printing business in Califormia was but in its infancy. The News is the representative of a most important locality on the Eastern Slope, and we trust it will receive that support and encouragemen' which it appears so well to merit. It is and encouragemen' which it appears

## MININGAND SCIENTIFICPRESS

## KUSTEL'S PROCESSEAS OF SILVER AND GOLD EXT\&ACTION.

Among the items to which we may today call favorable attention is one noticed on page 121. An instance is there narrated which occurred in the author's practice in Mexico He there states the result, "metallic copper iu place of iron" (in barrel amalgamatiua) "acts with little less energy than the iron, but not reducing the copper and lead chlorides to the metallic state, it renders a very pure amalgam."

Another process to which, however, Mr. Kustel makes some objections in view of the fineness of panamalgamation, is of interest from its anulogy with Patterson's lead process. It is due to Mr. Sutro. Mr. Kustel writes thus:
It is known that the silver amalgam that is obtained in the pan analgamation, consiots of regular crystals which are suspended in the quicksilver. 'The lead analgam, on the contrary, is entirely dissolved in the quicksilver when hot. If, therefore, the quicksilrer is presseul through a cluth while hot, the dissolved lead amalgam is found in the quicksilver, and the silver amalganin the cloth. A second filtration of the quicksilver when cold, gives the lead amalyam. The lead ocutaius three or four per cent. al silver.
We intend next week to present some comparative statistics of Califorian and Australian pan amalgamators.

## IMPORTANT TO WASHOT OPERATORS.

By a law of Nevada Territory, persons who may have cases for suit in claim for Miaing Gromd in that Territory, must have ineir complaints and answers filed before the 21st. of November, iust., or their claims will be forever thweafter barred. Persons who think they have claims for mining ground, now ia possession of other parties, and for which they are intending to bring suit, will do well to take nutice of this item, or they will lose the opportunity to secure their just rights.

A Notable Death.-Oliver Ames, of North Easton, Mass. died at his residence on the 11th. of September last, aged 86, But few men have lived in private life in this country, more universally or more favorably known among the laboring classes than Mr. Ames. He wàs one of the first among American Mechanics to andertake on anything like an extensive scale, the manufacture of shovels. He legan business, when quite joung, with limited means, and under circumstances which would have utterly discouraged almost any other man; but by a course of industry, integity and energy seldom displayed, his business rapidly increased and the reputation of his work excelled that of all others on the continent. Mr. Ames never made a poor shovch. It was our priviledge to visit his establishment, and make his acquaintance some 26 years ago. We never met a more unassuming
man, or one more beloved or respected by his employees. man, or one more beloved or respected by his employees. Even at the time of our first visit, which was often repeated
at subsequent interrals, he had acquired a handsome fortune, and entrusted his business mainly to his sons; yet his mode of life was plain and simple. He never, to the time of his death, made any ostentatious display of his wealth. He lived to a good old age, and died, at the close of a well spent life, respected and lamented by all. His life may justly be regarded as an example for every American mechanic.

Among the inventions recently announced is a "ship's berth boat," inteuded to prevent sea sickness. When used as a berth it accommodates itself to the motion of the vessel after the manner of maxiner's compass. In case of shipwreck, it may be used effectively as a life-boat,

Remarfable Occorrence.-A neglo cook in one of the regitments on Morris Island lately conceired the idea of making. sinkers for fish lines out of the lead around Parrott shot To this end he placed a shell in a stove and sat down, ladle in hand to catch the molten lead as it fell. Just about the time the lead should have fused, the stuve seperated into very minute fragments, and the last seen of the smelter was a series of involuntary gymuastics creditable to his agility but unpleasant from their ahruptness.
The Boise Mines.-Mauy persons are ignorant of the location of the Boise mining country. They are located about three huudred miles south of east fron the Dalles, Oregon; Umatilla and Walla Walla, Washington Territory; and some two hundred and twenty-five miles east of south from Lewiston, Idaho Territory.
Stramer For Tauoe.-John A. Crocker, of Sacramento, is going to Lake 'Tahoe, to construct a small steamer for navigatiug that romantic sheet of water.

The Mount Diabio Coal idines are now sending to market about 4,000 tons per month, the quality of which is constantly improring; it is now selling by the cargo, alloat. at $\$ 10$ per ton, Ooose Bay" Coal, (Oregon) has beeu sold at the sane price, which is also the present market value of that from Bellingham Bay. The steamer Esmeralda, which tows vessels on the Sacramento river, uses coal from the Mount Diablo mines, which it procures at Antioch. The boat has used this coal for making stean for some time, and its owners have great faith in it. Antioch is the location of the Copper Smelting Works, which are also using the Mount Diablo Coal.
The consumption of domestic coals is constantly on the increase, consumers being driven $t_{\text {}}$ its use by the high rates ruling for all other coals and frewood. This latter article is now very scarce and high, and readily commands by the cargo \$10 @ \$12 per cord.
National Finances,-It has been calculated that the present war impuses an average burthen of $\$ 20$ per head upon each man, woman and child in the loyal States. Great as this tax may seem, it is nothing to the burthen imposed upon the people of England during the six or eight years of the Napoleonic war, which was calculated at an annual levy of $\$ 41$ per cap $t a$, or a little more than twice the tax now resting upon this nation. It should also be borne in mind that the loyal States are now far better able to bear even the burthen which England sustained from 1809 to 1816, than that nation was thea, inasmuch as we have now reached a ten fuld greater degree of developement, in resources and commerce, than Great Britain had fifty years ago. These figures and lacts are sufficient to show pretty conclusively the ability of our people to boar the burthen imposed, and the fully of those financial croakers who are predicting anarchy and confusion as the result of our present extraordinary national expenditures. Those who make these predictions, whether among our own people or abroad, understand but little of the character of loyal Americans. The recent elections, even if we ignore all past history, afford abuudant evidence that there is no place in all this great republic, for a party which would inscribe upon its banners the repudiation of any engagement necessary to sustain the integrity of our governinent or the permanency of the Union.
'I'fe Debt.-It is stated semi-officially that the Governmeut enters upon the third year of the war with a debt of $\$ 1,220,750,000$. Acting-Secretary of the Ireasury Chittenden is reported to have said, in the course of his remarks to the Ohio soldiers in Washington, about a year ago, that foreign capitalists were beginning to invest extensively in Government securities: In a single duy $\$ 350,000$ worth of United States bonds were issued on foreign account. The money for the payment of the entire army to the close of November, which the Government now has on hand, was advanced by foreign houses.
Foreigners.-It has been estimated from facts obtained from the census and emigrant reports, that the number of foreigners in the loyal States, at the present time, including the children of foreigners born siuce the arrival of their parents in this country, exceeds one-third of the entire population of those States. The number of naturalized citizens in the entire Union, it appears from the receat census, is 4, 136,000, made up of the following nationalities:-

| Ireland. . . . . . . . . .1,611,000 | Italy . . . . . . . . . . . . . 10,000 |
| :---: | :---: |
| German States . . . . $1,198,000$ | Denmark. ... ...... . 10,000 |
| England. . . . . . . . . . 430,000 | Belgium. . . . . . . . . . 9,000 |
| Euglish N. America, 250,000 | Poland. . . . . . . . . . . 7,000 |
| France. . . . . . . . . . . 109,000 | Mexico . . . . . . . . . . . 7,0011 |

## Total.

. 4,136,000

California and Japan.-The New York Stockholderer of
October 6th., says:-"Parties interested in the trade between Cahfornia and Japan are in town, looking about for fast steamers. It is proposed to form a line from San Francisco
to Japan. The steamers, will natually, be armed, and will to Japan. The steamers, will naturally, be armed, and will ment, or by the priaces of Japan, so as to be available in case of war between Japan and any other nation. In view of the relations between Great Britain and Japan," it adds "it is hardly probable that our shipbuilders will supply the
vessels required."

Copper. - "We learu," says the Calaveras Chronicle from gentlemen who lave lately visited the mines in Campo Seco, that the copper mines of that famous district are constantly improving; three of them are raising and shipping the tinest qualit es of ore. Parties are prospecting for lodes in the neighborhood with every probability of ultimate success:
It is now pretty generally believed that copper cannot bo found near the surface, and companies are sinking their shafts the depth of from one hundred to two hundred feet before they loose confidence in their work. If found, a good claim is a fortune to the lucky miner, and will be a permanent source of wealth to the community. Unlike the early gold| diggings, which generally gave out by the time a town had been burned out once or twice, a copper distriet will warrant business men in putting up fire-proof buildings, and insure permanancy to even a California population."

Artesian Well at Napa.-The California Steam Navigation Company are sinking an Artesian well at Napa, for the purpose of supplying their boats at that place with pure spring water for steam purposes. Experience has satistied the company that the damage to boilers and machinery from the use of the brackish waters of the Bay and rivers is more expenisve than the cost of procuring pure water in the manner indicated. The well has already reiched the depth of 260 feet, and the company are confident in the belief that they will soon find the desired supply.
Land and Naval Practice.-It is accounted as a singular fact, (if it is a fact,) as recorded by our Eastern exchanges, that while not a single accident has occurred to the guns on board the Ironsiles and Monitore, five of Gen. Gilmore's guns of the same calibre as those used by the navg, have exploded or become damaged since the siege of Charleston began, Experienced naval officers explain this by the fact that the projectiles used by the Momtors were " slushed" or greased before being rammed home.
The Flutrd, Nail.-The London Builder says a company has been formed to bring into practical use a spiral fluted nail, recently invented in England. They are fluted and twisted in a machine, and are manufactured as cheap os common nails. The holding qualities of the nail are remarkable; no holes are required to be made before driving those of any size, and there is no danger of the board splittiog, however near to the edge the nail is driven. The spiral point causes the nail to revolve as it advances, and its tenar city of holding is equal to that of a wooden screw.
Prices of Cotton and Cotton Fabrics.-At a sale of cotton, October 8th, in New York, on Government account, 806 bales of Upland were sold in small lots, at prices higher than have been obtained at any otker time since the outbreak of the present war. That which was in good condition averaged from 907/8@92c. One lot in rather bad order brought $821 / 2 \mathrm{c}$., about the average price of Upland cotton for the year past. The market for cotton cloth, in New York, has recently advanced very materially. Standard sheetings, on the 12 th ult., were quoted at 40 c . and upwards; standard printing cloths at $17 e . ;$ madder prints at 25 e ., with a light business. Woolens have also advanced, but not in proportion to cotton.

About 300 men are now engaged in gold mining on the Chandiere river, near Quebec, C. E. The gold found there is in the form of small pellets, and is very pure; but searching for it is tantalizing. Some men will labor for days without obtaiuing a single grain, while others will make about $\$ \overline{0} 0$ dollars per day.
Sex of Eggs.-Poaltry fanciers have for a long time been endeavoring to find the sex of the chicken that would be produced, by the peculiarity of the egg. Two plans have recently been circulating through the papers: first-rough ends will produce cocks, and smooth ends, hens; second-if the air-bubble is in the center of the end, a rooster, and if at one side, a pullet will be hatched. Chas. H. Graver, a Long Island farmer, who does not take all he sees in print for granted, has experimented with the following result: first-of nine birds liatched from rough end eggs, seven were hens, and wo, cocks; second- of thirteen birds hatched from 'eggs with the air bubble on one side, seven were cocks, and six wore hens. So both these theories were upset.

CAL FORNIA MINING INTERESTS JN NEW YORK.
The New Fork Stockholdir, after noticing, at some lengtlr the receipt of the first issue of our "Mining Directory," and the accompanying remarks upon the mining interests of the Pacific coast, adds:
" But the remarkable movement of orga ized capital, now going on in Californa, is certainly something more than a mere speculation. It answers a public want. Untold riches lie buried in that country ; to bring it to usefulpess and develol e it, organized capital is necessary. The opening and working of our mineral deposits, throughout all the States, are but in their infancy. People will invest more and more their spare money in minng nperations, because, in spite of many failures, in spite of fraudulent speculations, they feel that there is a degree of certainty in them, which no othe field of industry can afford. With a sufficient capital, with integrity and ability, mining companies camot fail to be profitable concerns to their stockholders. Patience also, and perseverance, are conditions reguired to be successful. Some years ago, stocks of some mibing companies of San Francisco could be bought for a piece of bread, because, after a small expenditure for devplopement, they were nmble to pay any dividends. The original sharehulders who got rid of their stock, at that time, were lusers of course ; bat those who purchased stock and kept it have been singularly rewarded for their perspicacity.

There is no speculation having a greater character for certainty than mining operations, provided they are properly conducted. When mines have gone through a process of developement to ascertain their value; when indications of a metal in sufficient quantity have been obtained, there is 110 reason why those mines should not become good and paying dividend concerns. California is too far from the action of our capitalists; but the movement so energetically going on in that State to foster the mining interest, is an indication that large profits await those who will invest their money in nearer States or Territories, for the purpose of developing their mineral wealth. Colorado seems to us the must promisiog field for New York energy and capital ; for we helieve that it is destined to repeat the marvels of California, regarded till to-day as the mineral wonder of the world."

Carlessnmss in Using Gas.-The late unfortunate accident by which a promising and inteligent lad of this city lost his life, should operate as a caution to persons using gas, especially in families where children or domestics, often unused to gas, may have occasion to employ it. Many persons have a habit of lowering the gas light in their bedrooms to a faint et at night. This, to say nothing of its pernicious influance upon the health, may be productive of serious aecidents. When the gas is redaced solow, a very slight cause-the buzzing of a fly ever-will serve to put it out, and the sleeper is left to inhale a poisoned atmosphere, or to incur the risk of an explosion should any oue chance to enter the room with a light. Where gas lights are thus lowered, a glass should always be used as a protection to them. Many fires have occured in consequence of the dim light, not noticed after sunrise, on the window being opened by the occupant or servant; the curtain is blown against the buraer and a
fire ensues." fire ensues."

## ESNERAIDA STOCK REPORT.

But"little business is being done at Aurora in the way of transactions in mining shares, by reason of the great scarcity of money there. Tbe principal transactions are consummated by parties from this city, at a very low figure. Owing to various untoward causes, which will soon cease to exist. many a hard working miner, in that region, has been, or soon will be compelled to part with valuable feet at a sacrifice to supply actual wants.

We notice among the latest quotations, the following

## THE COPPER INTEREST.

One of the most encouraging features with regard to the--opper interest is the immunity which, as a general thing, it has thus far secured from the speculative mania which has so completely enveloped evergthing in the way of silver min-

Holders of copper shares, of real or perspective value, arpear to be satisfied with their ventures or investments, per se, and scemed to bave little care for auy speculative operations. Hyery one who has got a few feet in a developed or highly promising copper mine seems to have arrived at the conclusion that co; per is to be the stand-by-the sure thing, for permanent inrestment; and but few are found in the market with their "feet." The $p$ rmanency and uniformity of mines of copper are well known, and the fact that but little machinery, and that of the simplest and most inexpensive character, is required to dress and concentrate the ores, which immediately on such preparation have an easily ascertained and standard value, renders it extremely difficult to "operate" in copper. The thousand and one cases of "sharp pactice" whi h are so casily concocted in the derelopment and management of silver mines, are almust universally impossibilities when applied to the baser metal. A copper mine, as a general thing, alter the bed of ore is once struck, can be so managed a- to very nearly or quite pay the way to its fullest development. The day that a ton of ore is raised to the surface its actual value can be ascertained, and capitalists stand ready to advance very closely approximate to its full worth, and take the ore from the very month of the mine. Copper, of all the higl priced metals, is the one in which capitalists of either large or small means, can most safely invest, or the miner, with no other capital than stout arms and a willing heart can most conveniently embark.
We continue to hear favorable accounts from old copper localities, and new discoveries are almost daily announced. L. ring the past week we have heard of " most wonderful developments" in Indian Valley, about forty miles northwest of Colusi. It is reported that specimens of almost pure copper are taken from the ground, in large quantities, but a few feet only from the surlace. One correspundent says " you can find copper in chuncks all over the surface, ranging from 45 to 90 per cent. and the best in the State. Pieces have been found weighing ten pounds, containing nipe pounds of copper," and again, "the people from all the surrounding country started of, [for the locality] some is buggies, some on horseback, and some two on a mule."
Again, far to the south, and from near the extreme limit of the copper belt, so far as traced in that drection, we find the following item:-

Copper Prospects in Tulare--The copper prospects in the new mines on the Chowchilia, are improving. A specimen, about four ounces in weight, was lately taken from the "Tom Early " vein, completely stadded with pure cupper.
The Gardiner Company, is few miles above Auburn, have struck a well defined ledge, fourteen inches in thickness, which, it is said, will assay from twenty to thirty per cent.
From the Colorado we also continue to hear most favorahle reports. Erom a gentleman, skilled in matters, mining and inetallurgical, who has recently spent some considerable time in that region, we learn that the fars which have hetherto obtained to some extent with regard to the permanence and reliabillity of the mines there, are entirely without, foundation. He assures us that the copper mines of Colorado present as strong indications of continuity and depth
as any other mines in the State, and that the general geological features of the country are as favorable as could be desired. . I'bis gentleman has promised us some account of his experience and observations in the Colorado mines. Late letters from that locallity state all is prosperity in the mines, on the Colorado, and that "new discoveries were of almost daily occurrence. A number of companies were getting out ore for shipment. One or two warehouses are in progress of erection at the La Paz landing. The steamer Cocopalt was discharging a large cargo of miners' supplies at the La Paz landing, October 22d. She would carry below a number of tons of ore, which had been delivered at the landing by Mr. Tyson for shipment."

Dr. H. 'T. Stevens, the agent for the Colorado Steamboat Company at Fort Yuma, recently arrived at Los Angeles, reports that the boats, on their last trip up the Colorado, touk tools and supplies for twenty companies, who intend
opening the different leads along the river, and large ship-
ments of ores will soon arrive in Sam Francisco from that section.

The ship Invincible, which has just loaded at this port for Boston, has a large quantity of copper ore ou board.
The ship Industry, now loading for Europe has 20 tons of copper ore on board from the Arroyo Seco, a very promising mine, recently opened about three miles from lone City This ore is sbipped by Wm. Shiels, Esq., of this city. The same company have also sold another lot of similar ore to the Antioch Copper works.

## THE MINING SHARE MARKET.

The Mining Share Market still remains quite active, but transactions are chiefly confined to a few leading shares, most of which are in request at enbanced prices. The recent assessments upon unproductive companies has had the effect to induce many outside holders to close out their investmenta in that class of stock, often at grerious loss. Specnlators in shares, who have been quite generally sorely pressed of late, have also been compelled to part with much of their productive and high priced stocks, to enable them to meet calls for assessments.

With the exception of the more prominent and dividend paying slares, mining stocks are at present unavaliable as a basis for negociating loans. Hence the resort to sales, and the recent activity in stocks, in the face of a very general distrust in that class of investment. This activity has been also due, in no small degree, to the calling in of loans, consequent on the late action of the bankers, which has precipitated upon the market a large quantity of hypothecated

The business of the week has been chiefly confined to the Ophir, Burning Moscow, North American, Baltic and Sheba, with little veriation from prices of previous week.
The Ophir has beeu the chiel feature of the week. A large business has been done in this stock at greatly fluctuating prices; 948 shares have changed hands. 'I'hese shares opened the week at $\$ 1430$, adranced to $\$ 1630$, on the strength of the reported discoveries in the mine, but again weakened and closed at $\$ 1390$ bid with sellers a t $\$ 1400$. Diridends for this mouth have been sold at from $\$ 30$ to $\$ 48$, and for three months to come at as low an average as $\$ 29,50$ per month.
The editor of the Prices Currant of the 12th inst. accounts as follows for the recent extraordioary fluctuations in this stock:-
The fluctuations in the stock of this Company are attributable to a variety of causes: First. It has heen largely hyrothecated. Many of the h lders, availing themselves of its acceptability to capitalists as collateral, had borrowed large sums upon the pledge of it, and to a very great extent these loans had beeu empluyed in the speculative purchase of other
stocks of comparatively little value. T'he downward tendency stocks of comparatively little value. The downward tendency of the barket, and the general unsalebleness of the stock thus purchased. compelled the parties, when pay day came, to realize upon the Uphir as the only resource. Hence free sales became necessary, and the market was precipitated. In additiun to this, it may be stated that a good deal of dissatisfaction las existed with regard to the management of the Companys affiirs. Prominent officers in it have been at variance-its expenses bave been very heavg-an important suit has terminated unfavorably, and under circumstances adapter to increase any odinm that may have before existed against the company. The "Bears" have made the most of all this, adding various embellishments to suit their own purposes.
We have taken some pains to inquire into these matters, and are assured from authentic sources that the mine itself both looks and yields as well as ever, and shows no indications of gising out. The enormous expenses of the last month -some 90,000 -compelled the trustees to reduce the dividend below the usual figure; bur they do not expect a continuance of this, and they aver that the prospects of the mine under proper management are as good as ever. These views are entertained by many parties who sold out with the intention of reinvesting at lower figures, and have dona so, under the impression that the canses at work would force prices to a luw point, and that reformation in the management of the Company's business was all that the case required. The annual election of trustees will take place in a few weeks, and in the mean time the pressure of hypothecated stucks upon the market weing over, and the true conditions of things pretty generally understood, the stock has rallied handsomely without reaching the low point anticipated.
Burning Moscow still continues to be the favorite speculative claim, and has been largely dealt in- $\$ 848$ shares having changed hands at from $\$ 2721 / 2$ @ $\$ 325$. It is stated that this mine now presents a very favorable appearance, and that a large yield of Bullion may be confidently expected,

## ich regularity. in future. The shares of this mine have realy heen harraly increased hy a consulidatiun with the

 udison, Harrisun and La C'rosse Cumpanies.lhe North American has also been quite largely dealt in 169 shares having changed hands at from $\$ 55$ to $\$ 70$. ese shares opened the week at $\$ 555$, advaneed to $\$ 70$ and sed at \$ion. It is repurted that suits have been instituted anst this company for the recovery of a large number of
ares alleged to have been irregularly sold as tho property of inquents, and reissuod to other parties. Aouther assessnt of $\$ 10$ per foot will become delinquent the present ck. The Baltic has also been considerably dealt in at a mate 1 advance. This is the adjoining cluin to the Cncle Sam, 1 its advantage is attributable to symphathy with its neight r. On Wednesday 145 shares were soll fron $\$ 62(1, \$ 00$. Cncle Sam has advanced from $\$ 225$ to $\$ 2 \pi \bar{n}$, but with all sales-sellers shy-und this iu the face of an assessnt of $\$ 50$ per foot, deried ou the 2 d instant. A rich strike reported in this mine, with an abuudance of pay ore in itt.
Gould \& Curry advanced to $\$ 4,800$, and closed at $\$ 4,655$ cidends for this month have been sold at $\$ 130$, and are ely uffered at $\$ 138$ per loot. Many, however, are expectto realise $\$ 150$. Some new buyers are reported in the rket for this stock, and considerable difficulty is expenced in filling orders.
Sheba shares have uttracted considerable attention during week, at fluctuating rates. They opened at $\$ 95$, fell to 0 , but finally recovered and closed at an advance to $\$ 120$ thirty days.
Orerman has been but slightly dealt in, and at a decline m \$700 to $\$ 400$. This decline may be attributed to conned litigation and a contradi tion of the rumored consol tion of this company, the Mary Anu and North Ameri, the three claims to take 2000 feet on a southerly diree" from the Belcher.
Real Del Monte it firm at $\$ 425$ bid, and $\$ 460$ asked. The eepts of bullion from this mine are now very large. The mpany has now 100 men in their employ at the mine. ey reguire the utmost capacity of four mills to crush their ok. The clean up for the week ending Saturday, Oct. 31 lised $\$ 4,000$ from about 490 of ore-equal to $\$ 11.0 \mathrm{pe}$ 1 ! It is asserted by the friends of this company that we all hear of results from this mine, which shall exceed any ing heretofore realised on the Eastern Slope, as soon as it of Decenber. They have already about 500 tous o oice rock reserved for that mill. I'he mine is now well ened out-some 600 teet of galleries having been run. The ening of the mine, and the erection of the mill has been ection of Mr. C. F. Woon, an old Nevadian, of much ex rience in mining. Mr. WV. is about to yield its manage ant to the hauds of another Nevadain, Mr. Wa. Malt
N , also a gentieman of large and most successful expe nce as a mining superintendant.
The Antelope is also quite firm at abont $\$ 150$, in the face an assessment of $\$ 2.5$ levied ' on the 17 th ult. This comny is taking out excellent ore from one of the deepest afts in Esmeralda District.
Wide West is quoted at slight decline, with about the aal business.
silver Hill at $\$ 20$; Ural at $\$ 130$; Utah at $\$ 48$; Bamboo \$30, and Esmeralda \$18.

Greek Fire--Speaking of the Greek fire with which Gee, Gillnore has been experimenting at Charleston, a writer in au Linglish scientific journal expresses the opinion that the substance " might be so formed that it would actually burn under water." What the English writer thinks "might" be done really bas been accomplished at Morris 1-land; several experiments to test the powers of the fire in that way having succeeded admirably. It was also tried under ground. a can filled with it having been placed in a bole dug four feet deep in a saud hill, and then covered up, the earth being soaked with water and batted hard down upon it, On removing the earth, in the course of a minute or two, the substance was found to have barned itself entirely out.
The witer just alluded to states that Scott, the inventor, offered his discovery to the 'British Government during the Crimean war, but was so discouraged and disgusted with the "circumlocution management," which it was ecessary to go through with, that he withdre his offer, and finally placed his invention in the hands of the Federal Government.

Mining Agescr.-By reference to our advertising columns' it will be seen, that we have made nrrangements to obtain specint information, through a resident enrrespondent, with regard to any prrticular mine at Recese River. Parties in the city about to invest in "feet"
 incur the expeuse of visiling the locality, will do well to a vail themselves of the opporturuty hereby presented of securing reliabls
Persons already holding "fent " and desirous to learn through a disinterested source the nctual coudition of the mine is. which they may be intorested, will do well to embrace the enportuni, $\gamma$ here presented of recuring the
desireut informationin.
We shall establisl a the prineipal mining distriets, at an early day.

A PATENT BLASTING LOCK
In our last issue we made some notice of o receutly inveuted machines for rock drilg. 'To day we present the acrompanying astration of a very useful and ingenious litpiece of mechanism which may prove a pat useful and appropriate accompanyment a rock drilling machine, and which, in fact ould be employed in all cases where any asiderable amount of blasting is required. is instrument is known as "Hughes' BlastLock," and sold by Messrs. Haghes \& ch, at No. 408 Commercial street, in this y In order that its utility may be underd, we give the following descriptiou of mode of using it. which will be clearly unstuod by carfully reading the same in connection with the istration.
First cock the instrument by pulling the brass knob repre ited upon the extreme right of the illustration; then put fater-proof cap on the nipple seen in the opening of the ander; next cut off the fuse one inch above the surface of ruck in which the blast has been put, and insert the lock the projecting fuse so that it will enter the muzzle as far possible; then raise the lower lever till it stands at a rightle with the cylender. When ready for use the upper lever ch acts as the trigger must always be down on the cyleuCare should be taken that the chain/connecting the levers, is not kinked or tangled; if it is so, when you I the cord it will pull the machine loose before the cap sts. If used in a shaft, the upper end should alw.lys be at the top, when all is ready, ascend the shaft, or rere to a place of security in the mine and pull the cord. $\$$ machine will at the same instant disengage itself from fuse, to which it had previously been fastened by the er lever, and should be promptly pulled out of the shaft sway from the vicinity of the blast. The lock should lays be kept well oiled and the muzzle cleaned like the rel of a pistol. A single blast or a series of blasts may hats set off at the same instant.
The advantages of this machine are immunity from danger, eat saving of fuse and time, and a greater certainty of harge from the employment of a shorter fuse. The lock ly if ever fails in its duty. In sinking shafts, where blastis required, the adrantage is very important, as will readthe perceived. The machine weighs put a few ounces, and be readily forwarded by express or mail wherever it be desired.

Live Copper Spectmen.-A very fine Specimen of Copper From the Eureka Coinpany, Nevada connty, may be seen il:ont of the Express Building, on Montgomery street. The. ) simen weighes 226 t bs, and was taken from a shaft at the lith of seventy feet, only.

Aper vs. Gold.-There are 88 banks in Rhode Island, a capital of $\$ 21,000,000$, on a specie basis of a trifle half a millioa.

IItahes' Blasting Lock.

## LETTER FROM REESE RIVER.

## Austin, N. T., Nov. 8th., 1863.

Edtror Mining \& Screntific Press:-The Virginia City Enterprise, of the 5 th inst., gives currency to some ridiculous street rumors, which are calculated and probably intended to deter capitalits from investing in the Reese River mines, and which doubtless originated from jealousy of a growing rival. These rumors are to the effect that loads of silver ore from the Gould \& Curry are being shipped to Reese River for the purpose of "salting" worthless claims, and that a large amount of bullion has been purchased at Gold Fill, brought out here and run into bars, and palmed off as the product of these mines. The first of these rumors, the Enterprise thinks, is "absurd," for the reason that the ore from the two regions is as much unlike as coal is from chalk, and no man here could be deceived. The Editor, had be been disposed, might have given several much better reasons for discrediting the story. Without doubt there are many worthless claims in the Reese River District, which the owners would be glad to sell; but were they disposed to. "salt" them, they could get plenty of grood ore for the purpose in their own neighborhood, without going to the expense and trouble of purchasing it in Virginia and paying ten or fifteen cents a pound freight to Austin. The other rumor, the Virginia paper thinks, is more plausible, but viewed in a proper light it is equally as absurd as the first. Our mills, it is true, are not turning out as much bullion at the present time as had been auticpated by those well acquainted with the richness of our mines, but the article can be readily purchased here at a discount of five and six per cente, and a man would be a simpleton to send to Gold Hill for it, where he would have to pay nearly its assayed value.

A reader of the Virginia City papers cannot fail to have noticed that they never omit an opportunity to make a fling at the Reese River mines, while the mines of Humboldt and Esmeralda, rhen referred to at all, are spoken of in the most respectful terms. The reason is they bave well grounded fears that their far-famed Comstock will soon be eclipsed by the rich silver veins of Reese River, while they have no fears of rivalry, from Humboldt and Esmeralda.
Of the several thousand ledges, located within five or six
miles of Austin. it would be ton much to expect that all would pay for working, hat if one in a hundred pays, Repse River must shurtly become the must impurtant silver-produeing conntry the worlul has ever kinwa. Hurking tests lave been made of ruck from over a h.adred ledges, and the yidhls liuse certainly exceeded what could have reasunably been expected. Uur mill men lack the experience of properly tre ating the ores, and the mills are not supplied with the requisite machinery for saving the silver, yet with these drawbacks, scacely an instance has occured in which the yield was less than a hundred dollars a ton, and the average yield will brobably exceed two hundred. This is mach greater, as I am assured by those who know, than the average yield of the Comstock mine. Our mones, it is true, are mostly small, and none of them will compare with the Comstock for size: but there is one adrantage of small mines which should not be overlooked-that is, the saring the expense of timber. A ledge of one or two feet in thickiess can be safely worked with very little timbering; but to work a ledge the size of the Comstock, in à country like this, where wood is not plenty, the expense of timbering would be enormous.
Having resided here for several months, and carefully examined several hundred mines in this vicinity, and laving; withal, had considerable experience in quartz mining, I have no hesitation in predicting, that in one year from now the bullion shipments from Reese River will exceed the present shipments from Virginia, City; and I shall be much disappointed if Austin is not, in less than three years, the second city on the Pacitic slope.
T. H. R.

Tue Unron Gold Mining Company of Klamath Co.. have recently got their mill into very successful uperation. They are runuing eight stampe with steam power and crushing about 12 tons per day. Their arerage "clean up' " is about $\$ 300$ per day, or $\$ 25$ per ton-a rery good business.
We have received several very rich specimens of ore from the "Illinois" and "Golden Age" mines, Reese River. The 1llinois has a shaft thirty feet deep, with a vein fire feet wide. The Golden Age has a shaft down 35 feet with a three foot vein, well developed, and regularly increasing with the depth. These companies have determined to prosecute the work of developmeit during the winter months. Bath have quite an amount of good ore already out, and each bid fair to soon take a high rank among the rich mines of Reese River. The idea that once obtained credit that the Reese Ruver reins were too small to work, or were not to be depended upon in depth, is now pretty well exploded.
Among the recent scientific agricultural suggestions is one for improving chalky soils by using sulphate of iron as a ma* nure. It is stated that just as a preparation of iron is psescribed to the human subject when the blood is poor, so poor and barren soils nay be greatly improved by sulphate of
iron. and

## [Froum our Traveliug Correspondent.] <br> CAMPO SECO.

Mr. Ediror:-When I started upon my present route of inspection, commencing from the Keystove claim in Copperopolis, up the Salt Spring Valley north to Campo Seco I thought I could axcomplish the whole in three days, and include the result in one letter. I find myself mistaken in both calculations. The mines in this section are so numerous, and far apart, that for the present, I must omit those in the valley and confine myself to those around Campo Seco. By this arrangement I shall save time, and avoid confusion.

It will be unnecessary to say much about the town, as people generally, I presume, are familiar with it. Before the "copper age," Campo Seco, like many other small towns in the interior, which flourished under the "golden age," was falling rapidly into insignificance: During the three years elapsing since I was here, I observe several striking and gratifying improvements. The town looks cosy, and well-to-do; the people are orderly and of a most respectable class. The two hotels, the Hooker and Phoenix, are well kept and and comfortable; while the stores, and the appearance of things in general, indicate a new spirit, and that Campo Seco under King Copper, is destined to become quite a place.

And well it may-for the mines so far as developed, are of first-class character. At San Prancisco you have no idea of the advanced condition they are in, buth as regards the developement of the lodes under ground, and the excellence of the works above ground. Their position, however, being over fou $\iota \bullet$ miles apart, east and west of the town, requires a few preliminary remarks, to make it comprehensible to people at a distance.
Since I reported upon the Gopher District, I have given the country in all directions a more close and thorough examination, and I find each of the three systems already described, contain at least four distiuct and seperate veins. This fact, though it may sound strange to many, is never-the-less very obvious in the Copperopolis Falley, at the Collyer and Plymoth Rock claims; it is equally so at the Massachusetts Hill, three miles wast, and I am satisfied it is the same at Gopher. I had adopted this opinion before I reached Campo Seco; and, here I find the three systems, in character, position, and distance apurt, exhibiting themselves precisely the same as they did 20 miles south. If geology in certain respects, "is never at fault," there is no other way than this, of explaining the difficulty and contradiction at once apparent to the investigating mind, if an opinion is to be formed of the probability of general success by the location of each shaft. Many intelligent gentlemen, to whom this contradiction has long been apparent, as it was to myself from the commencement, now admit my theory has the strongest claims to consideration, inasmuch as it ultimately ensures success to all the prospecting going on, which otnerwise would be a matter of very doubtful propriety.

I think as far as Campo Seco is concerned, the linear course of each system may be thus safely located. The Copperopolis lodes, strikes the Comeh claim in the valley, go to the Forty nine and Liberty claims, and thence to the John Bull district on the Mokelumne river east of north three miles above the town; the Massachusetts Bill lodes, west of north, one mile and a half below the town-while the Gopher lodes range somewhere about Poverty Bar, and Lancha Plana to Tone City, where I am satisfied they can be struck in the neighborhood of the cemetary. The advantages of this theory, in three respects, are immense; it certainly proves these copper deposits to be one of the greatest wouders in world; it suggests more safe and paying investment for the redundant capital of the State, than all the far off Reese Rivers and Devil's Gates put together: and, if syatematically observed, will save the companies, different lodes north and south of Copperopolis, an untold amount of money, labor and time. It is an old axiom, that whenever science gives certainty to labor, it is in that proportion valuable and authortative. If I am correct in my theory, than the labor going on around Campo Seco, iavolving thousands of dollars, must be successful; if not. the greater portion or it is a foolish. desperate speculation, conceived in temerity, pursued in temerity, which will bankrupt eventually two-thirds of those interested. I take it for,granted, all who understand mining will admit at once, that to comprehend distinctly the system you seek to develope, its locality and linear course, is an immense advantage; because, that knowledge discloses the two
great secrets of successful mining-viz, where to commence, and what to do. Such I hold is the advautage this theory confers; and applying it to the Campo Seco'm nes, it points only to two undeveloped claims, which in the end will prove failures.

After this explanation, it will no longer seem strange to our readers not thoroughly posted in the mysteries of mining, how a variety of claims, running in parellel tives, four or five miles apart, can all be successful, or expect to be so in the end. I shall now introduce you to the Campo Seco mines, no less important or numerous than those already described. It will be most convenient to commence with those lying west one mile and a half below the town. First, on the banks of the Mokelumue river is the

Copper Hill.
This mine, at present, is one of the two most important in the neighborhoud. It. is incorporated, containing 3,200 feet, divided into 3,200 shares. The main shaft is 280 feet deep with four shafts. A large quantity of valuable ore has been shipped from this mine, though the yield is not so great just now, simply because the black ore is changing into the yellow sulphurets. In fact I got a piece of rock off the bottom, which it was impossible to tell from the Massachusetts, on which system I locate the se mines. If this lead opens here, as it has at Copperopolis, of which I have no doubt, high as Copper Hill stands, in will more than double its value: All the work at this mine are excellent. A large water-power wheel forty feet in diameter is being put up, which will be a great improvement. Fifteen hands are employed day and night. No stock in the market. A short distance south on the same lead comes the

## CAMPO SECO.

This mine is the compeer of Copper Hill. It contains 2,600 feet, divided inte 200 shares. The main shaft is 100 feet deep, six feet in the clear, exceedingly well put together, from which a drift runs east 70 feet, Out of this I took the beautiful specimen of blue ore I send for your cabinet; the other, (black) perbaps richer, comes from the bottom of the shaft, where like the Copper Hill, the vein I think, is giving way to the main lode of yellow sulphurets. This mine has also yielded a very large quantity of these rich colored ores, and will continue to yield them in large quantities for years to come. The drift is a splendid piece of work, and does the Superintendent much credit. The mine is worked by waterpower, the wheel being 40 feet in diameter. All the upper works are very complete and efficient. The sorting-shed is sixty by thirty feet, from which a track 410 feet long runs to the shaft. The only thing wanting is a pump, and that they are preparing to put down. It is much needed below. A number of hands are also enployed here night and day. The Campo Seco stock ranks high, and deservedly so, for it fully merits its reputation. It will take another year, however, to derelop its real value. Next in succession, but on another rein comes the

## lone star.

This claim contains 1,500 feet, divided into 1,500 shares, being incorporated. The main shaft is 95 feet, but, at present, the lead though very large, is equally corrupt, bearing antimony, iron, and arseniates, as well as copper. Still the indications are flattering. The prevailing error of sinking the shaft too far west has been committed here, and, they have consequently to run a long drift through very hard rock to cut the vien, and then the old tale, a new shaft. will be needed. Nevertheless, the mine ultimately must be valuable. On the Lone Star, as throughout all this section, the croppings are spleadid. On the other aide of a small creek, and directly opposite, is the

## lancha plana.

This claim is incorporated, and contains 3,200 feet, divided into 3,200 shrs. Main shaft 164 feet, from which runs a short duift to the west. The Lancha Plana enjoys a very high local reputation. I could not go to the bottom of the shaft, as the men were timbering, so I did not see the vien, which I understand is very fine and large. I regret this as I was anxious to see what resemblance it bore in formation and character to the Massachusetts. The Lancha Plana bas yielded large quantities of first class ore. At present the Company are preparing to put up an engine of twenty horse power, which when completed is expected to develope great things a few minates walk south from the Lancha Plana brought me to the
higbee.
This claim has 2,400 feet, divided into 2,400 shares.

Main shaft 65 deep. The Higbee is not on the same lead; the Lancha. Plana and Lone-Star, but that of the Camy Seco and Copper Hill. Work is suspended here for a tirr to erect machinery for hoisting, and as the shaft was full water, I could not, of course go down. Undereloped, hor ever, as the mine is, the stuck bas a local value quite $r$, spectable. I understand the lead opens very handsomel strong sulphurets following the talc down all the way. Ner, the Higbee on the same vein is the

## Hawes \& co.

This claim contains 1,200 feet, divided into six share Main shaft 85 feet. Like the Higbee, this vein opens vel handsomely, carrying all the elements and indications of large strong lode. All it needs is depth. Work going $c$ steadily. Last on this side of the town, that I cruld hear of meriting notice is the
omaha,
This claim contains 1,400 feet, divided into 1,400 share Main shaft 75 feet. Work is suspended bere, for the presed to prepare machinery for hoisting. Wheu resumed, tl company intend running a drift to the west. The ledge ro is very strongly dev, loped and very promising.
I must now return to the town, ana proceed some thr miles in an opposite direction to John Bull district. T mines in this section are unquestionably on the "Uniu lead," and with one exception, are all exceedingly promisinf The country is hilly, barren, torn up, rough, bearing a strol mineral aspect. The lodes here on the surface are well d veloped. I shall commence at the river. Immediately the banks is the

This claim contains 1,400 feet, divided into seven share Main shaft sixty feet, somewhat small, bat very well til bered. The vein shows itself beautifully. I think the copp will be struck first in this mine, owning to its favorable lor tion. Next in rotation, is the original claim of the distris the EUREKA.
It contains 2,000 fect, divided into ten shares-incort rated. Main shaft, 140 feet. At the bottom, the vein rapidly concentrating, with a very handsome hanging wi The work in this shaft is well done, and neat througho The acconmodations are good. There are about forty to of No. 2 one on hand, which will be largely increased befc Spring. The Eureka is a fine institution and well conduct Next comes the
bay state.
This claims contains 3,200 feet, divided into 3,200 shan Main shaft 84 feet, with the vein opening on the botto Like the Eureka, the work here reflects credit on the Sup intendent, only the ladder is too long in the steps for a m with short legs. According to appearances at prese twenty or thirty feet more, ought to strike good ore. T rack is vary pure all the way down. Accommodations go Since writing the above, magnificent ore has been struck this claim.

BUNKER HILL.
In my opinion, this shaft is altogether wrong in its locati and shows few or no indications of a vein. The drift at bottom running east is still worse. They should prospl the opposite hill to the west. Behind this claim a short ( tance east, comes the

WINFIELD SCOTT.
This claim contains 6,400 feet, divided into thirty 1 shares. Main shaft is down thirty feet, just commenced a splendid opening, and a strongly developed lead.

## sebastopol.

It contains 4,000 feet, divided into twenty'shares. shaft thirty feet, a counterpart of the Winfeld Scott, equally favorable prcspects of success.
spring ranci.
It contains 6,200 feet, divided into thirty-one shares. shaft fifty feet, carrying from the start a well defined lt It has now a splendid hanging wall, and may certainly be c sidered an established fact. Some 300 feet from this cist lies the
morning star.
It contains 6,000 feet, divided into thirty shares. J ommenced under equally favorable auspices. Last in section comes the
mount fernon. It contains 3,000 feet, divided into 3,000 shares. M
haft fifty-three feat, in which they have struck a small

Mining Notabilia-Extracts from Correspondence, etc.
the romitiork lfad.
From Tirginia City and vieinity, we continue to hear most favorable acconnts. The Ophir is still taking rery rich ore from the spur or lead dereloped by the recent "cave."
The Central, No. I, are down 400 feet, perpendicular, where they have a fine lead developed. The California, next adjoining on the south, are down about 300 feet, where they have a fine vien of ore. The Compuny have recently put up a very fine house npon their mine, with all necessary convenieuces for actual operations.
The Ceatral No. 2, are still driving ahead their branch from the main Latrobe Tumel, which is to strike and develope their ground to the depth of nearly 500 feet. They bave now a little wer 100 feet to run, through very tarorable ground. Much anxiety is felt by all Comstock owners, in this vicinity to see this important tumuel reach the Comstock Lead, which it will fist do on the Central No. 2 ground, and within sixty or ninety days.
The owners of the Kenney ground ( 70 feet) are doing nothiug, but waitiny for develupments by their neighbors. The White aud Murplyy company, who own 210 feet, are actively engaged in clearing off their ground preparatory for the erection of house, machinery, etc. During the present season they will put up their bouse. and a "whim," and commence a shaft, which will be four by twelve feet. In the Spring they will put up heavy machinery, and push on as speedity as possible to a full development of their mine.
The Dick Sides, next adjoining, Company are now down 200 feet with their main shaft, which is corered with a substantial house. They hare their machin ry on the ground, which rill soon be upand running.

The Best \& Belcher are keeping space with their next neighbor. just noticed; both are going to work on the right basis, for properly opening their mines.

Next in order of succession comes the Gould \& Curry. This mine is too well known to weed any particular notice in such a sketch as this. The deeper they go in this mine, the richer the ore appears to be. In their lower gallery, the ore surpasses anything yet fonnd in that famons claim, both in quality and quautity.

The Savage, next adjoining, are still taking out very rich ore, and plenty of it. This is one of the first class mines.
Our correspundent confesses to not being particularly posted as to the Hale \& Norcross, but believes it to be a good mine.

The Chollar has the best works on the Comstock, and our correspondent thinks that it will soon be second to none in the T'erritory. The Company is now taking unt cousiderable ore which is paying well-about $\$ 50$ to the ton. They are now supplying four mills, and will soon be in conditivn to keep a dozen at work. Our correspondent saw a few duys since at an a say office, "bricks" to the amount of 200而s of bulliou, worth $\$ 5,500$, the result of 100 tons of ore which had just been put through the mills.

The Potosi Company are taking out some very good ore from the north end of their claim, but at the suath extremity, where they recently erected a small engine, they have shut down, evidently pretty well satisfied that there is nothing south of the Chollar line, at that point. This Company are now opening their third gallery at the dept of 310 feet. : The ore which they are at present taking out, comes from the first gallery at a depth of 180 feet. Very superior ore was struck on the 14 th. inst., near their engine shaft in the second gallery. This mine is under the management of Mr . De Land, and the manner in which work is now being prosecuted, and the substantial character of its machinery, reflects the highest credit on his energy and skill as a Mining Superintendent.
" 420 ," a name by which the next adjoining ground is known, have let a contract to sink a shaft 150 feet -4 by 12-for $\$ 22$ per foot, the contractors furnishing ererythiug. The claims situated south of this point, are embraced within the Gold Hill district, of which we shall defer mention until another time.

## Austin, Nov. 14te., 1863.

Mr. Epitor:-The Miners of this district, subject to a call made through our local paper, met on the 11 th. inst., and decided that the mines should not be laid over, by a unanimous rote. After which a resolution whas passed requesting that this decision should be communicated to the most important papers in this 'ferritory and the Stato of

California; among which I find the name of your valuable paper, and I mas as well say here, your enterprising journal, by its steady, and devoted efforto iu behalf of the mining interests in general has given it no small significence among the miners of this district.

What would have been the position of our mines, had this movement on the part of some few drones who would like to spend the winter in more congenial quarters, and hold on more feet then they could work, is too suggestive to be misunderstood. Tte fate of Humboldt with all its native wealth, stands spectre-like before our fision, and warus us of our danger. We will improve by it.
In regard to this place, such has been the rush of enterprising tradesmen with a large stock of goods of every hind, that they now stand at their doors, if they are so fortuuate as to have any, like a skipper on the quarter-deck, whistling for a breeze. [Customer?]
Mechanics as a general thing, have bad the best time of it. They have had lucrative and constant employment. Medical men have poured in by scores, proffering their services, offering balm and consulation to the sick aud dying - for a consideration. If the spark of humav kinduess predominates; it proves a dangerous experiment, for ten chauces to one, his labor goes unrewarded andhe must besides purchase his own medicines or see his patients fade like the leares in Autumn. By a combination of the druggists, the price of drugs is the greatest burden we have to complain of.
No one living away can possibly know the amount of sickness in our midst. 'lhe cold weather is now upon us, and handreds are unprepared to meet the storms and must be exposed, endangering their health and multiplying the objects of charity, already alarming.
If this is pluin talk, it is the truth, nevertheless, and as acorrespondent of your candid journal, I am, I trust, bat car rying out your injunctions when you evjoined upon me to write nothing but the truth and the whole trath. Such has been the denand on public charity, that our county commissioners have resolved on opening a hospital at the earlist date, and when it portals are opened, the rush will be beyoud its capacity. Many do not like this liberality ou the part of our commissioners. It will multiply their faxes. forsooth ! I will ask, what shall we do? Shall we hoand up our treasures, gather in our harvest, and say we have no interest in our fellowmen? God forbid! We have men of hearts, as well as nerve, and we will help the afflicted, and look to an approving conscience fur the reward. To such men as Judge --, a gentleman well known in California, are we indebted for this act of public benevolence. May Heaveu ever smile with approbation on his big heart, is the prayer of many noble souls, now restored to health, who are too full of gratitude to express their thanks for his nutireing, indomitable efforts in their behalf. Did 1 not know of his many acts of kinkness I might say less. Should this communication ever meet his eye and affurd him pleasure, let him understand, I am not done with him yet, and the whole people will cry Amen.
In my next I w 11 treat of the mines in this neighborhood, and the extent of their development. Some yaluable discoveries have been made quite recently. One called Amador, in the Yankee Blade District, has created a great excitement. I have seen some of the rock and it certainly looks like the best in this district. I shall make it a visit, and will give you the result.

## THE NEWTON COPPER MINE.

The Newton is ranked as one of the leading copper mines in the State, perhaps second only to the Union. The Proprietors were offered $\$ 250,000$ for the mine somosix months since, with a condition; $\$ 250,000$, without conditions would have taken the mine at that time. A much larger amount of coin at the presont time, however would fail to take it. This mine was furst opened about one year since. The first shipment of ore was made in January last. Since that time 1000 tous of ore bave been shipped, having been disposed of at highly renumerative prices; $\$ 20,000$ was received from one party in this city: Until recently all the ore raised from the mine has been sold without sorting:. The better plan of assorting the ore has now been adopted, and it is now divided into Nos. 1 and 2.
The mine has been opened. by two shafts, one of which, is
130 feet deep, and another 250 feet distant, is 70 feet deep.

From the first shaft a drift has been run 200 feet north anc 60 south. The second shalt is still going down. The shafte are all on the lead. Some ides may be oblained of the strength of the same from the fact that all the ore yet maised. about 1,200 tons, has been taken from these shafts anc drifts; stopeing has not yet commenced. The mine has paid expenses from the beginning. No assessment have evel been levied upon it, and probably none ever will be. It is the intention of "the proprietors to thoroughly open the miue in such a mannur, that wheuever the proper tacilities for transportation are presented they can put a large force a work, and raise several hundred tons of ore per month. A present these facilities of transportation are confined to re turn teams, all of which are loaded as fast as they presen themselves at the mine. A railroad has already been pro jected from Stockton to strike the Pacific or Folsom ruad a some point above Sacramento. This road will pass withil about 12 miles of the Newton mine, aud it is expected tha by another jear the mines of that region will develop suff cient busimess to warrant the construction of a branch to Ion City. The mines of that region will not be thoroughly de. veloped until railroad facilities are opened up for takiug th the ore to market.
There are no croppings on either the first north or sout extention of the Newton mine. Croppings which preser themselves are on the second extension only-our notu are at fault whether north or south. We are indebted for th' above particulars to Mr. J. Newton, one of the propriepor and brother of the Doctor, with whose name the mine he been mure particularly associated. The mine contains 1,80 feet, divided into nine shares of 200 feet each.

## MORE UPON CADMIUM FLUXES,

A publication of the hour revives the idea that a valuab discovery has really been made in Contra Costa Count Sacramento Street was once made to divide the honor, bif this claim is pronounced " wild cat." 'there rever was ar cadmium. There is nothing but a natural combinat on. Th proprietors of the land must get all the ole is worth as a fic or whatnot. No one may share with thent-no one else mey get anything for discovering (pshaw ! that a natural cobs bination has a greater value than a simple mixture. Its a plication is nut. patentable. (?) Is not this the argumeat of ulf monopolists? We think we do not mistake it. Thanks totl present discussion, we learn that the Contra Costa materi occurs "under the many forms-of an earth enclosing crysta of macle- of a lamellar mass breaking into leaves like slat lastly of a hard dark green rocks." Ainong its many forn five different men have, at least, found onie which contai cadmium. This is of no other value, perhaps, than showin that at present the subject is not exilausted. We are to by avery learued compiler that it may be compared with, $t$ argillaceous schist of the Lower Hartz, but that the nultiplici of its bases, renders this silicate as superiol to the schist, Newcastle to Mont Diablo. The multiplicity of bases fon bly remints us of the six days fight which resulted in change of base. Is it at last come to this that the val of this cadmiun flux is only to add fusibility? We do my deny that this is of value - but so is a nickel cent if not in California-it has not the true ring, we do not see color. More than increased fusibility and much more is, quired to constitute "a very effective flux by the aid which the differeut combinations of copper and other meta can be reduced. It is "a siticate with many bases" $b$ slags formed with it (?) have been seen by us which indicas that it has a sufficient excess of silica to absorb much ipe Is it then acid or basic, must we mix it with sand or wi iron? Some of the same slags appear to contain a propo
tion of copper so large that their peculiar "fusibility" ds not seem of much advantage -this may have been only dr to defective manipulation-is this a correct assuuptior These several points are still undecided. The proprietors the land, if they are to be the only parties to have an intert in this claim, may well be at the expense of definite examis tion.

Eils in Canals.-The well-known French author, mund Alout, has proposed that the French Governme shall stock all the canals in France with eels, both a source of revenue to be raised on grants of the right to fil. and of a cheap and wholesome food for the poorer classes | the people.

## MINING SHARE MAREET.

Transactions have been exceedingly light during the last weuk, with great fluctuations. Buyers in davidend paying mines have been intueaced by the prospects of future divsdends. The interest in must of the speculative shares is very much abated.

Gould \& Curry has declined to $\$ 4,400$. Jividends of this Company will hereufter be declated on the fitth of the month inotead of the twenty-eighth, and has heretulore been the custom. Thi arrungeasent will cuable the company to sell their bullivu on steamer days, thereby uviling themeelves of the entire proceeds ul' the previaus monti. 'The dividend fur the carrent month, will, it is thought ho \$lou per fout, but this is us yet, sumewhat conjectural. Dividends lave been sold firr \$130.
Ophir opened at $\$ 1,400$, and advanced to $\$ 1525$. Novenber dividend has been suld as high as $\$ 4 \mathbf{j}$. Traneactions in these shares have boon swall in comparison with the gales live the last few weeks,

Yotusi shares bave met with a serious decline, owing it is sadd to the prospect that the C'ompany's ledge will soun dip into the Chultar gromed. (eve our Mining Notabilia.) The Prices Courrent, in alluding to this report, suys:-" It is proper to state that this repurt is uct fully credited by those who ought to be well informed in the promises, and that other causes are assigned fur so markod a depression in the stuck of the C'umpany.

Chollur stares have fluctuated from \$i25 (a) \$900, closing' at 8 i5. It is sabd that a butter quanhty of ure has beea ex tracted from the mine racently and that the general teatures of the ledge are mach more thatering than tormerly.
Lelluw dacket has been sold at $\$ 920$ (a) 930. It is not often pressed upou the market by weak hotuers.
Best de belcher dechued sughty. Uperativas in this stock are very loght and there are but fow sellers except at full prices.

## Lucle Sam advanced from $\$ 350$ to $\$ 400$ and was well

 maintanedBurniug Moscuw has been in less fapur and sales have been at a material decliue. Large trabsactions have takeu place
 same celluote to whell we alluded last week, still cuntinue to depress this stuck - an increase of the caphtal stuck frum
 Harrisun and la crosse Cumpanies.
loupersul has sull turher dechued. Large expenditures and the inability of the L'ompuny to accumulate a fund tor the dividend account, it is stated, occasiane this depreciation. $\$ 200$ is bid.

Sheba rose from $\$ 95$ to $\$ 125$, buyers 30 , but is now lower Returas trom ore shipjed some time since to Lurope for reduction were expected by the last Yunama Sileauer, fut advices received sutistactorly explain the delay, and at an early day the result ut ten tons may we luoked tor. Su leet were suld at the cluse at 95 @ 101, chiefly on sellers option.
Sierra Nevada has tallen from $\boldsymbol{q}^{2} 9$ to $\$ S$, owing to auother ussessment of $\$ 10$ per foot. This Company have expeoded a large amount of money in their efforts to tind a wel $l_{1}$ established lode, but thus lar wathout sucess. $\$ 70$ is bid.

El Dorado rose trom $\$ 50$ per foot to $7 \overline{0}$, occasioned by the rumored failure of the Gould \& Curry Company to procure a permancut injunction againist it. it was weaker at the cluse, and sold at $\$ 6250$.
Baltic has been in some faver, and advanced from 60 to 90, but at the cluse is nut so strong. Sales at $\$ 80$ (a) 81 .

Grass Valley has buyers at at $\$ 6250$; Caledonia Tunnel Comijany, $\$ 35$; Michigan, \#3̄. Wide West, fell to 61 ; Silver thll, \$18; Josephine, $\$ 5 \overline{\text {; Coso, }} \$ 8$ à 0 ; Sheba, decliued to $\$ 95$; Melones, $\$ 8$; $;$ Blue Ledge, $\$ 9$; Uuion, R. D., $3,70$.

Owens River has recently become a favorite, owing to some develupements made in the lead of the Company. It is said that this mine abounds in ore working up $\$ 1000$ to the ton in gold, and that no difficulty is experienced in extractr ing it.

## Santa Rita, a claim of 900 feet, adjoining the Owens Riv.

 er, has suddenly risen from $\$ 10$ to $\$ 25$, in sympathy with the latter, it is supposed.Mipa Prieta (Mexico) sold on Friday at $\$ 210$. The last intelligence from the mine if quite favorable.
The Company's mill was stated to be at work, crushing 10 tons of ore fer days yielding about $\$ 1.50$ per ton.

VIRGINIA CITY STOCK LIST

Fine Specimen of Sllver Orf．－A fine specimen Mexican silver ore，may be seen at the door of Faulkner \＆Son， 411 Clay street， weighing about 400 pounds and assaying $\$ 300$ to the ton．The specimen is from a large mass， thrown off from the vein at a single blast． The Company has about 100 tons of similar ore at the mouth of their mine，ready for ship－ ment，with plenty more of the sane scrt to raise．Three distinct veins pass through the Company＇s ground，which w il average about six and one－half feet thick，seperuted by about 50 feet of unproductive rock，resembling iron ore．The San Antonio District is one of the most promising in Mexico，and is fast fill－ ing up with American adventurers．

Tabor \＆Hill，Real Estate Aents and Stock Brokers，place their card in our cill－ umns to－day．Messrs T．\＆H，are members of the S．F．Stock \＆Exchauge Board and San Francisco Board of Brokers．Any business entrusted to their hands will be promptly and faithfully attended to．© They may be found at 402 Montgomery street．

Mintra Agevct．－By reference to our advertising col－ umns it will be seev，that we have ruate arrangements to obtain special iuformation，Lleough a resident corres－ pondent，with resard to any particular mine at Reese Rivor．Parties in the city about to invest in＂feet＂
in that neigbloorbood，and not having time or cariug to incur the expeuse of visiting the locality，will do well to avail themselves of the oppinrtunity hereby presented securing relable iuformation，previous to iuvestment， at a moderate cost．
Persons already holding＂feet＂and desirous to learn through a disinteresterl seurce the actual condition of the mine in which they may be interested，will do well to
embrace the opportunity here presented of securing the desired informstion．
We shall establish ngencies similar to the above in all
e principal mining districts，at an early day．

## VOL. VII. SAN FRANCISCO, MONDAY EVENING, NOVEMBER 30. 1863.

NO. 5.

Rocod Valley, Nov. 22d, 1863.

## Miving and Scientific Press: 'Tis not often I write

 a fact, I make a poor fist at it-bat, with your permission, vill make my grand clebut in "Bay (iircles," as my return d, unsophistocated friead sail the other day. I write for hree reasons : because this region, so little vaunted, at leas eserves notice ; because the printer wants copy, and beanse it is meet that we oceasionally throw a fow rays of Jalitornis true light, in the paths of those blinded by Boise, leese or other distempers. True, these places may be rich, have we uot as good country at our own doors? Howver, it is idle to reason with those afficted with the "fever," or " distance lends enchantment to the view."In these grand old hills, that stretch from the Columbia to he Colorado, and from the Pacific to the Great Basin, slumer countless thousands of veins of gold, and silser and coper, that time and willing hands will yet reveal. You need Iot go to the far-off Frazer, nor to the wintry heads of the Yolumbia ; nor to the burning deserts of the Great Basin, to ind them; but here, on 'Fornia's bounteous soil, is a field so astly extended, that the yet unborn, will reap fabulous forunes from their own discoveries.
Fearing that this strain will not suit the "practical," I ilil turn to local affairs.
Round Valley, from which I write, is situated near the ent e of Plumas county, and is of but litile consequence as valley; what little notoriety it does pos ess, is derived from numerous gold-bearing quartz ledges in its vicinity. As
facilities for working, this country is unsurpassed; timber every variety and in the greatest profusion, abounds on ery hill-and lying apread in full view of every ledge, is dian Valley, embracing fifty thousand acres of as fine agcultural land as there is in the State.
The Ellis Ledge is the pioneer ledge, nine handred feet of hich is owned by the Round Valley Quartz Mining Comhy, who have two fine quartz mills in operation, one with elve and the other with sixteen stamps. They are said to doing well ; a proof that "there is something in it," is st the mills have been operating successfully for nearly two 3rs. They have excavated to the depth of two hundred d fifty feet.
The ledge of first importance, however, is the Blood ledge, nod by Bolinger \& Co., who have a twenty-four stamp mill fall operation ; it is yielding most handsomely; it does 4 soul good to see the glitt ring bullion every clean up. Next comes the Waterworth ledge, at Granyille, two miles tant, which is truly a master ledge, and when worked with isple machinery, I believe will be equal to the best. WaterHeth \& Co. originally owned the whole of the ledge, but id one half to Messrs. Blood \& Harvey, who incorporatec Nicr the name of the "Indian Valley Quartz Mining Co. ]addition to those named there are four other quartz mills ipperation, and all of them seem to be doing something. told is not all we find in this region; copper is also found il 1 bundance. The Superior Ledge, owned by Major Bidpi \& Co., situated a short distance from here, promises to $\nabla$ with Copperopolis ; also the Gennessee Valley Gold and ()per leads are ranked among the best.

Space will not allow me to particularize, but in future I contemphate giving yon a geographical view of the country here, as also a minute description of the working and appearance of the several miues, adding any further facts that may present themselves.

Benedict.

## Austin, N. T., Nov. 20, 1863.

Mr. Editor: I have now been in this mineral kingdom about ten days, but bave not yet availed myself of any opportunity to visit the reported good ledges in this vicinity. We have had some little snow and rain, but all is fair again, and tha ground is almost destitute of any suow, and all is lively in the haste to get our winter shelters completed. I bought lomber to build me a small house, but speculation claimed too much for a building lnt; therefore I piled up my lnmber and hired me a room until Iean satisfy myself about which is to be the great city of Lander county, and whether he mines will warrant half the expectations placed in them. There seems to be four or five mills pretty nearly ready to run, and some of them doing now a smashing business. I noticed this morning our second sew mill in operation, cutting from our short nut pines, good framing timbers and roof lathings, much cheaper than buying them at $\$ 400$ per m. ft. I meet with none who do not seem to have the fullest assurance that this is a great mineral section, and that the next season will prove a harvest of much wealth. When we look at the investments being made by mill and mercantile companies, it argues strongly for their confidence. I will endeavor to give you my impressions of mines, \&c., here, very soon -just at present I am very buisy roofing \& large building, and this contract completed, I will expect to take notes on the hill side.

Yours, truly,
B. $\mathbf{W} . C$.

Mercorial Vapors.-A writer for Herper's Magazine, in giving a bistory of the celebrated Almaden mine, gives the following description of the deleterious vapors arising from the works:
"One of the most curious circumstances connected with the New Almaden mine is the effect produced by the mercurial vapors upon the surrounding vegetation. Despite the lofty chimneys, and the close atteution that has been devoted to the secret of effectually condensing the volatile matter, its escape from the chimneys withers all green things around. Every tree on the mountain side above the work is dead, and some of more sensative natures further removed exhibit the infuence of the poison in the shaken and blanched foliage; but these effects do not extend to any great distance. Cattle feeding within half a mile of the hacienda, sicken and become salivated ; and the use of the waters of a spring rising near the works, is guarded against:: It does not, however, affect a mineral spring near by, which possesses the peculiar qualities of soda or Congress water. The workmen at the furnaces are particularly subjected to poisonous fumes. These men are only able to work one week out of four, when they are changed to some other employment, and others take their places for a week. Pale, cadaverous faces and leaden eyes are the consequences of even these short spells; and any length of time continued at this labor effectually shortens life, and impregnates the system with mercury.

In " Reid's Handoopk to Neweastle," the particulars are given of the raw material consuned per ammom in the alkali works of the kingilum: - sait, 255,600 tuns; coal, 951, non tons: brimstone and chalk, 380,500 ; pyrites, 264,000 ; nitrate of sida, 8,300 ; manganese, 3.300 ; timber for casks, 3,300 : totol, $1,834,000$ tons. "Nearly one-half of these materials are worked up in the neighborhood of Neweastle. The salt employed is almost exclusively the produce of the Cheshire mines; but at the Felling works rock salt from Ireland is dissolved and hoiled down by waste heat from coke ovens.

Ingentous California Invention.-Mr. J. S. Henning, of this city has made application tor a patent for an ingenious iuvention of a machine or contrivance fur recurling music as it is played upon an iustrument. The principle of this invenwill not be made public until the patent is secured. The prime agent, is electricity, produced by a novel method, differing from a galvanic battery heretofore known. Mr. Heaning was also the origiuator of a self-reporting telegraph instrument, patented by Amos Kendall, and is the party who proposes to build a telegraph fire-alarm in this city during the present year, if the City Fathers so direct. Mr. H. has devoted much attention to the study of electricity, eapecially in regard to its application to economic purposes.

A Surscriber," writing from Diamond Springs, is anxious that our "Traveling Correspondent". should visit the mines of El Dorado county, and report upon them, as be is now doing upon those of Calaveras. It is our intention to keep one correspondent constantly in the field, whenever the roads are in proper condition for convenient travel. We fully agree with "A Sabscriber" as to the importance of such a course, and trust he may soon havethe pleasure of a call from the correspondent of the Paess.

Large Sales of Mining Ground,-L. A. Booth and Gross \& Lambard, have lately sold to the Eclipse Mining Company, ten feet of ground in what is called "Gold Hill proper," for the snm of $\$ 55,000$. This ground, though steadily worked for the past three years, now shows more ore than ever.

IT is reported that the W'ashington District, which lies about forty miles to the south of Austir, Reese River, is proving rich and extensive.
The Oldest Rose Buse, in the world is supposed to be at. Hildeshein, in Hanover: It was planted in the ninth century by Louis the Pious, and in 1078 Bishop Hezilo had a wall built around the tree to protect it., It has lately put forth new shoots from the old roots, one of which is twelve feet high and nearly an inch in diameter.
The Stokton Independent thinks that in two years Washoe will contain 200,000 people, and be dependent on Califorcia for breadstuffs.
Letter from Esmeralda.-We would call particular attention to a very excellent letter from Esmeralda, which will be found upon our second page.

## ESMERALDA.

The mining district known as Esmeralda is situated mainly in the county of the same name in Nevada Territory but running over the line, seperating the Territory from the State, into Momo County; California. Aurora, the municipal town in the district, is nearly due east from San Francisco, a distance of 250 uniles. By the Route mainly traveled heretofore, via Sacramento, Placerville and Genoa, the distance is 380 miles. A good wagon road, however, is being constructed across the mountains from Sonora, Tuolumne County, which was within two weeks of completion when the snows prevented the further prosecution of the work until Spring. When this road is completed Aurora will be within two days of San Francisco, by steamboat and stage: The geographical position of Aurora is favorable for growth. independently of its mineral resources. It is in a direct line from San Francisco to Austin, Reese River District, shortening the distance about 200 miles, The Sonora rond completed, supplies for Reese River, Excelsior, Silver Mountain, Monitor District and Owen's River will naturally find their destination through Aurora, that being the nearest and best route to all the places named.
climate.
Much misapprehension seems to exist in relation to the climate of Esmeralda. That there is much siekness and many deaths occur for the population is true, but most of the instances of mortality are tracable to other causes than the unhealthiness of the climate. With the same conveniences and care the climate will probably prove as healthy as that of San Francisco. Substantial improvements, adapted to the cl mate, are constantly being made, and with these there can be little doubt but that the health of the district will improve, which even now will not suffer in comparison with any other one east of the mountains.
as a mining district,
Esmeralda is regarded by many as under a cloud, and the earnest enquiry is repeatedly made; "Do you think the mines will ever be successful $?$ " or "Is the story of the uncounted wealth of Esmeralda only a golden dream, destiued to disappoint all who have cherished the hope of renumeration for their toils and sacrifices?" These enquiries indicate a want of information in reference to the work already performed and its encouraging results, notwithstanding the numerous disadvantages which the district has suffered. The discovery of gold and silver bearing quartz here was made by a few adventurers some four years ago. Pitching their tents in a gulch half a mile soutr-east of the present city of Aurora, their attention was attracted by the heavy quartz croppings on the sides of Silver and Middle hills. The discoverers are said to have been without capital and could only stake out their claims and wait for something to turn up. They were more than a hundred miles from any settlement, the geography of the country was little known, they bad no supplies, no roads, and the surrounding country presented only a grand disolation, whose hills and gulches had vever echoed to the voice of the white man. The report which these discoverers made soon attracted a large number of the same class, so that before any considerable capital was enlisted a large proportion of the best ledges had been appropriated by men who had not the capital, if they had the energy to develop them. This fact accounts for the comparatively slow progress, made in mining operations in the district.
the quartz mill.
Another occasion of delay and disappointment arose from the class of mills at first erected. However much expense and time these projectors may have devoted to them they were utterly inadequte for crushing the rock and separating the metals. Some four or five of the primitive structures still stand, as silent monaments of the folly of attempting to force the bullion from the rock, however rich, without proper appliances.

There are now seven mills in the district, capable of doing satisfactory work, embraciag an agregate of 86 stamps, only six more than the Gould \& Curry are now running. These mills are all busy, night and day, nearly all of them on two claims-the Pond and Real Del Monte-the only ones in the district fully opened; the latter producing $\$ 100,000$ per month. The whole amount, from all the mills, falls a little short of $\$ 200,000$ per month. Three additional mills are in process of erection-the Real del Monte is nearly or quite ready for operation, having a battery of 30 stamps, and in al
its appointments equal to any mill east of the mountains. The Antelope, with twenty stamps nearly completed, and the Durand, just commenced. All three are to be first class mills.
wild cat speculations.
Another serious drawback upon the development of Esmeralda Mining District, was occasioned by the graceless wild cat speculations of last winter. It seems difficult to decide whether to be amused or indignant at this phenomenon called "Wild Cat." J.he sellers were not honest or the buyers were not shrewd. If it were allowable to manage a little, it perhaps might be said that the declaration that they who will be rich fall into a snare, was exemplified in both buyer and seller; the latter being snared by the temptation to dishonesty and the former into loss by his credulity. But cats, whether wild or tame, like dogs, must have their day, and the wild-cat speculation has risen, flourished and declined, leaving the seller with the reputation of having lost his conscience and the buyer with the conscionsness of having parted with his money without receiving un equivalent in value.

## GOOD FROM ETLL

But it is said there is no unmixed evil in the world, and so it seems likely to prove in this case.
The decline in stocks has induced holders to develop their ledges. That Esmeralda Mining stock will come up at no distant day may be regarded as mainly certain. But they will rise on their own merits. The time and rate of advance will depend on the labor and capital devoted to taking out and working the rock.
the rock is rich.
Fifty-two consecutive assays taken from the books of Van Night \& Winchester's assay office, the record of assays made from rock taken from the different claims in Eemeralda district during this year, show an average of $\$ 445$ per ton. This, of course, was most of it fair selected rock, and cannot be regarded as a fair estimate of the product of unassorted rock. But the lowest estimate we have heard of, the product of the rock crushed during the last six months is $\$ 75$ per ton, aud a large proportion of it has exceeded $\$ 100$. One company, the Pocasset, before its consolidation with the Crocket, was offered $\$ 110$ per ton for their rock, at the mine, but declined the offer. The Pond, the Real del Monte, the Antelope, the Utah, the Chemung Tunnel, Durand, Brewster, Middle Hill Tunnel, Manita and numerous other claims, so far as developed, are equally promising and will in due time blow their own trumpet.
But, the inquiry is respeated, "If the Esmeralda mines are so rich, why do we not receive the bullion?" Well, sure enough. Why? For the same reason that the Feather River does not furnish any water for the bay of San Francisco. All its resources are emptied into the Sacramento, and that river receives all the credit. Esmeralda bullion falls into the Washoe current at Genoa and comes down as bullion from Washoe.
But what about the Wide West? Honestly we cannot tell. It is apparantly a great swindle or a great fizzle; and yet, from all the facts accessable to an outsider, a Philadelphia lawyer could not decide which it is, or whether either. The story goes that in shifting Superintendents and hands the original Johnson ledge, from which their rich ore was obtained, was lost and though they have looked for it with lighted candles, for many weary months, no trace of it is visible. So to pay expenses the magnificent mill is crushing Del Monte rock, and the company are still hopefully searching for the lost treasure. It is to be hoped that the search will be more successful than the one made in the Polar regions for Sir John Franklin, though some cherish the belief that the game is to "freeze out," and others, that the whole thing is effectually frozen up as the distinguished northern adventurer himself.
J. B. Saxton.
A. Loyal and Useful Citizen-Mr. T. C. McCaffey, of Knoxville, Tenn., served three months under Genéral Jackson, thirty-two months in the Mexican war, twelve months in the present war, and has sent eleven sons to the Union army, four of whom were killed before Vicksburg.
Iron-clads.-There are thirly iron-clads now in the course of construction from the plans of Ericsson. There are in addition to these, a large number of different construction, now upon the stocks or just launched.
"The American Tea Company" was chartered by the Legislature of Pennsylvania, it having been represented by the tea-plant grows indigenously upon portions of American soil, and that they possess most of that soil. The company hare employed Dr. Spencer Bonsall, an man of experience and character, to examine the American tea-plant, and he speaks most confidently and encouragingly as to the success of their undertaking. Dr. Bonsall is a gentleman of good reputation in the scientific world, and for sis years be held the responsible position of superintendent and chief manager uprn the lands in India of the Assam Tea Company of Calcutta and London. He has reported specifically on the present undertaking. He declares that the tea-plant exists in Pennsylvania and Western Maryland beyond all duabt. "It grows indigenously," he states, "in the greatest luxuriance and abundance, in the places that I have risited, limited, however, to those localities which afford the peculiar soil indispensable to it, as is the case in Ohina, Assam and Japan." The character of the plant differs somewhat from the Chinese variety, but the difference is not greater than might, be expected from the difference of climate and soil of the two countries, The leaf-and this is the important point-is almost identical with some of the varieties from which the best tea is made in Assam; and Dr. Bonsall expresses his belief that tea equal to any brought from China to this country could be made from this plant. He thiuks that the specimens of both black and green teas that have been prepared from it should satisfy any unprejudiced mind that they will bear favorable comparison with imported teas; and their appearance and quality will improved as the manipulators become more expert, the present process being rude.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents-American, Euglish,French and Belgian-will secure an inventor exclusive manoply to his discovery among one hundred millions of the most intelligent people in the world.
Models are not required in any European country, but the . utmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to take out foreign patents, ergrav. ingsshould not be published until the foreign applications bave been made.
The facilities of business and steam communication are suen, that patents can be obtained abroad almost as easy as at homs. The majority of all patents taken out by Americans in foreign countries are obtaiped through the Mining, and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

Caution.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caation the latter against beeding such applications as they may otherwise fall into the bands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entruat their cases to the care of a competent, reliable agent at bome.

While it is true of Most European conntries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchuser for bis invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and abillity. Inventors should beware of speculators, whetber in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions:

Eels in Canals.-The well-known French author, Edmund Ahout, has proposed that the French Government shall stock all the canals in France with eels, both as a source of rereaue to be raised on grants of the right to fish, and of a cheap and wholesome food far the poorer classes of the people.

Stoar fron Swiks - Sugar has been obtained from the skins of siakes by a Freuch chemist, and the process is given in the daily journals of 1'arris.

A cerrors observation respecting the rapidity of eaghes in thrir flight, has just been made by a traveler crossing the Grison Alps. An eugle, in flying from one mountain peak to another, at a hight of eight or nine thousand feet. performed the distance of five miles in five minutes.

Tufre has aleady been received as comutation under the enrollment act $5,500,000$, which suin, and all muneys hereafter realized from this source, are to be expended in bounties for enlistments.

Sonora and Mono Road.-The work puon this road, which is alluded to by out Esneralda Correspondent to day, has been suspended for the season, but will be resumed a the earlicst possible moment. Persons tho came over the route within a few weeks past (before the late fall of snow,) inform us that the road was thes in fine counition, and ouly about six or seven inches of snow on the summit. Tlue workmen employed on the Patterson contract had all left the monntains, and Learitt's and Hot Spring's stations on the other side, were deserted. 'I'he new road, so far as it extends, is admirably constructed. The traveler can travel mile after mile on a broad, smooth road, almost as level as a floor. When completed, this will be by far the best moututain highway in California or Nevada. The Commissioners, having finished their labors for the present, made their leport last week.

Processes of Silfer and Gold Rxtraction (waste?)-by Geido Krstel-SAn Francisco.
In fulfilment of our promise of the week before last, we present some results ohtaiued in Victuria, Australia. The accounts derived from the London Mining Journal, have more than the usual amount of authenticity as they are connected with litigation in one case, and with dividends in the others., Mr. Goulding is the inveutor of an amalgamator of the Wheeler Pan class. It is thus discribed:
"Mr. Goulding's machine does not materially differ from an ordinary arrastra; but being constructed of iron, and in segmeats, is capable of removal with far greater facility. The great improvement, however, appears to cousist in the mode of feeding; by attention to which, Mr. Goulding has succeeded in obtaining very excellent results: The pan is a circular one, with a round bottom; and the drags which are used as a substitute for the ordinary stones are cast to fit The segments are bolted together, and the joints made tight by india-rubber, or other suitable washers; and the drags being placed in position aud attached to the arms, the appa ratus is ready for operation. Mr. Goulding thus describes the mode of using the machine:-Put in slowly j cwts. of pulverised quartz from the stamps, and add as much water as will reduce it to the consistency of mortar; then pour in 10 tbs . of mercury, and let the machine work for one hour, at ten revolutions per minute; then open the trap-hole in the pan, and let the contents be discharged into a wooden trough, from whence the ore is carried off by a stream of water to a "shaking-table," in which the waste is separated from the quicksilver and amalgam. This operation is opposed to the old method of feeding and dischargii g continuously, but the results are at least double what may be obtained by any other way of working the same machine. The amalgamators may be-worked in tiers, one above another-that is to say, in parts, two machines being worked by the same vertical shaft; and, with proper working, about ten of the pans may be'worked by a 20 -horse engine. The dry griading operation shonld precede the wet amalgamation process. The drags are grooved for amalgamating, and withont grooves for the dry grinding. The long mooted question of getting all the gold is, in Mr. Goulding's opinion, solred in this pan. and he claims that each pan can amalgamate 5 tons in 24 hours; and with ten pans, which would give 50 tons a day, or 300 tons a week, the working expenses, including fuel, management, labor, \&ec., would be less than 2 s . per ton. Some of the machines have been in use at Stieglitz for some time, and have given satisfaction."

Mr. Bland the resident director of the Port Phillip Co. reports that--twenty tons of roasted blanket sand which according to an assay previously made, yielded 1 oz 7 dwts and 10 grs , to the ton, [probably 2240 tbs .] yielded in Messis. Rob-on \& Lancashire,s arrastra only 15 dwts- 20 tons of unburnt blanket sand which according to previous assay yielded 3 oz 6 grs per ton, were reduced with a result of 18 dwts. per ton. Mr Goulding claims that this arrastra is identical with his own.
The Independent Company paid a dividend of 281. 8\%. per share for the month, from 100 ) tons of quartz, which yielded only 151 ozs. of gold, or a fraction over 3 dwts . to the ton.

The New Perseverance Company, on the White Horse, paid all working expenses, and placed 160l. to the credit of company, from a month's crushing of 1600 tons of quarts, which gave only 119 ozs. of gold, or about $11 / 2$ dwot. to the ton. The quartz was taken from an open cutting about 40 feet deep.

Mr. Fox, President of the Miners Association at Helstone, is our authority for statiog that a jigying machine (of Mr. Hunts) had extracted 12 grs. of gold--the whole quantity the stuff contained-from a ton ol sand brought from Yan Dieman's Land. Let it be observed that this is little more than 1 part in 100,000 . If this be true, jigging for gold is as good as assaying, in Cornwall, at any rate. : If we now turn to the book whose title heads this article-a diligent search will disclose the following matter for comparison.

| Smiths Process common 4-foot Pau. | Wheeler's 4 -foot Pan. | Hephurn's 4-fuot Pan. |

[^13] Loss in silver. 40 to 50 pret. 30 to 35 pr ct. No statem't

## Samples, Page 85 [1.]

lines, Pages 85 and 82 [2.]
Chemicals Pages 84 and 110 [3.]
Adhesion of amalgam, Page sit, [4.]

1. "The difficulty in stating the loss is chielly found in the attempt to get a reliable average sample for the assay, especially it wet crushing is goivg on, The sulphurets and gold are al ways concentrated in the vats, where the ore falls in from the battery, and every inch in it shows a different anonnt of silver. The next vat shows the same difference, having, hesides, alrealy so much slime that a mixing for the purpose of haring the metal equally distributed in the masi, is impossible without drying.
The Calculations on the superiority of Wheeler's paus, at least to the present date, are derived from the comparatire yield and the uppearance of the tailings, according to which these pans seem to yield at least ten per cent, more than the pest common pans.
2. A great difference as to the result will be found in a comparative working of the finest sediment (the slime) which glides between the muller and the common pans almost motioulcss, as if it were oue mass. while in Wheeler's pans the slime is forced under the muller with the same speed as the ore.
3. This is also the reason that it seems as if the quicksilver were protected by the chemicals against being gronnd to scum, because the black powdered quicksilver is less visible. Purposely applying a very low temperature, the amalgam, apparently pure, turned black after retorting, and consisted mostly of iron.
4. It occurs often that a great part of the amalgam denosits in the amalgamating pans. At other times, no deposit of amalgam takes place in the pan 4 , or one pan may retain as much as one hundred pounds, wheu another has none at all. It seems that this appearance depends on a variable electric condition of the iron.

We regret to say that the data on which this is stated as to the effect of electricity, are not given-thas it has little scientific value as it now stands. We, ourselves, however, hare observed in a pan in which an electric current has passed through the quicksilver, that the amalgam froze on to the spaces between, and not cuvered by, the guide blades.
We cannot conclude these comparisons better then by quoting from page 116:
"At Mansfeld, where Ziervogel's method is practiced, in extracting silver from copper matt the lose of silver, according to the recent accounts of $\mathrm{D}_{\mathrm{r}}$. Heinbeck, is 7.06 per cent. in roasting and 1.20 in extracting the silver, making the total loss of 8.25 per cent."
It stands thus, then: California and Nevada Miners! you are wasting from 20 to 40 per cent of your silver over necessary loss, and yet you are told that you will never adopt "precipitation" which saves it.
Stars.-The number of variable stars hitherto observed is about eighty, and it is the opinion of some astronomers that every star under the third magnitude is variable. One of these stars a few years ago, apparently disappeared altogether, but about a year ago it re-appeared suddenly, with more effulgence than ever.

Lengthening the Erie Canal Locks.-The New Tork Pos' says: "The engineers on the Erie Canal are making a survey for the proposed extension of the locks. The surveys and estimates are for locks two hundred and twenty-five feet long between the gates, and wide enough to pass boats twenty-six feet wide-the estimate to be presented to the Legislature on the first day of its next session. It is supposed that locks of these dimensions will enable boats of five hundred tons burden to navigate our canals, and also to pass iron-clad gunboats into the lakes if required. Some idea of the size of these new structures may be obtained when it is remembered that the present locks are only one huudred and ten feet long between the gates, and seventeen feet four inches in the bottom."

Wabhor Granite.-There is a great deal of this material used in building in Virginia, many of the larest fire-proofs having their window and door sills and cappiogs, and steps fromed of it. It is a very excellent material for building pur-poses-being light in color, and much softer than the granite in California. It is but little more difficult to cut than ordinary sandstone, but becomes very much harder on exposure. Correctly speaking, it is not a true granite, as it contains no mica-its components being quartz, horubled and fieldspar.

Auleged Rich Strike. - The Virgtnia Union of November 5 th, says:
"We were yesterday shown a fine snecimen of rock, taken from a ledge just struck upon the Pride of Washoe. It was of a silgular character, being composed of iron pyrites and rich sulphurets of silver. The mine is situated in South Spanish ravine, on the northeast side of Mount Davidson A tunnel has been run into the hill, and at a distance of one hundred and filty feet from its mouth, a shaft one hundred feet deep sunk. From the bottom of this shaft a drift was ruo sixteen feet north; then a straight shaft was sunk eightyfive feet, and at that depth this roch was struck. The ledge exends clear across the shatt, which is six feet wide; how much larger it is is not known. This point is about two hun. dred feet below the surface.

Fine Copper Ore.-The first shipment of ore- 10 tonsfrom the Fureka Consolidated Company, on the Green Ledge, near the Zinc House, Nevada county, arrived in this oity on Friday last, and can be seen at the Pacific Warehouse ; this is one of the finest lots of sulphurets which we have ever examined. We understand the company has a very beavy vein of this ore, and are just beginoing to take it out: They are now raising about five tons per day.

## MEXICAN MINES.

San Marcial appears to bave been drawn from the market, owing to the excellent prospects of the Company. Their mill has been started and works satisfactorily. A large quantity of good ore is stated to be now on the surface.
The Tecoripa Company, it is said, hase taken out considerable ore. Their mine is believed to be a promising one, and a mill is to be erected at once.
The Providencla, a portion of the famed Santa Juliana vein, is being reopened and occupied by new owners. The latter mine, tradition says, sielded $\$ 3,000,000$ in seven years.
The Cruzecitas Company are at work in the erection of reduction works, etc. The requists machinery is now at the mine, and the mill will, it is supposed, be in operation within a few months. A large force is employed in enlarging their shaft and in extending drifts.
The Refugio Company is very favorably spoken ot. Ample machinery has been seut to the mine. Two veins of gold and silver bearing ore are to be opened immediately.
In the vicinity of these mines and near the old mining town of Jesus Maria, there has been found lately a Quicksiver lead, said to be very valuable. It is represented that at a depth of 18 feet the vein of cinnabar is more than three feet in width, averaging about 25 per cent. The attention of capitalists will doubtless be called to this important discovery so soou as a thorough test of the mine has been made. Meanwhile the work of developement is to be Figorously prosecuted.

- Messrs. Coffey \& Risdon are constructing a large and substantial brick building, on Market strect, for their boiler works.

## MINING SHARE MAREDT.

The transactions of the week have been quite limited; is part owing to tho prevailing depression of the market; the interuption in consequence of the observance of the annual Thumbsiving Iay, also operatiug to dimiuish, to a large ex. tent, the anount of busituess.
Uphir shares haves slightly improved, with cousiderable fluctuation, as will be noticed by the sules of the week. The accuunts from the mine, particularly from the recent strike in the nurtheru portion, continue quite encouraging, which, in connection of the large remittances of bullion, warrant the expectatiun that the coming divideud will reach \$48 per foot.

Gould \& Cunty remain at about last quotations, and have been but little dealt in. Dividends for November have been held at $\$ 120(a \leq 130$.

Burning Muscow has been the chief feature at the Board. Opening at quite all advance over closing rates of last week these shares gradually fell to a figure $\$ 20$ below the lowest rates of our last quotations. It is ufficially stated, that of the large increase of shares (now 6,000.) in this company, recently created by its consolidation with three other compauies, 1,900 are reserved for the benefit of stockholdersan important consideration to buyers.

Baltic has been considerably dealt in, first, at an advance, but clused at from $\$ 3$ (u) $\$ 6$ less than last week.

Caledunia 'I'unnel Co. has been in considerable demandtwo hundred und six shares laving changed hands at from \$35@)\$45

Potosi shares declined to $\$ 1050$.
Yellow Jacket, sold first at $\$ 1000$ and declined to $\$ 940$. Overman declined on first sales to St2.), then fell to $\$ 400$. Uncle Sam, declined to $\$ 325$; North American, to $\$ 60$.
Bullion, has a market at \$45; El Dorado, \$51 ; Charles Cany, $\$ 10$; Grass Valley opened at $\$ 60$, and closed at $\$ 50$, sellers; Buckeye, \$10.

Wide West has met with a fair business, opening at a marerial advance, but closing at $\$ 67$.

Chiluahua and Western Summit have also been largely dealt in ; two hundred and tweaty five shares having been sold at irom $\$ 25(a) \$ 35$.

Sheba is enquired for at an advance over last quotations. It opened at $\$ 11$ and closed at $\$ 160$.

Melones has a market at $\$ 90$; Union, Russ District, at $\$ 3,25$

A Prophecy-The Humboldt Register thus prophecies: "Taking the past as a guide for the future, we can sately predict that in ten years from this time, Nevada Territory will have a population of five millions; her alkali plains will be threaded with railroals; she will be connected by rail with the Pacific and Atlantic occans. Mines, rich as the Cphir will be successfully worked in all parts of the 'l'erritory; nor will we then be circumscribed to the business of mining for gold and silver. Our mouatains of almost pure copper will be of value; our abundance of the bestiron ore in the world will be brought into use, and our acres of the purest salt abundant for the use of the whole world, lying ready to be sackec, will then find a market.

## REMOVAL,

The Office of the Mining and Scientific Press, has been removed to Rooms Nos. 56 and 57 Goveroment House, corner of Washington and Sansome Streets. We have been induced to make this change of location, not ouly with the view of securing nure room and better accommodations for ourselves, but chiefly to better accommodate persons having business with the office. Our location is now central, easy ${ }^{3}$ of access, and in the direct way of the chief travel of the ity to and from the Post Office.

A Grost ciub has been organized in Lon don, having for its object a research into the possibility of "ghosts," or the appearance of the spirit upon earth, after death. That the club is in earnest, may be gathered from the fact that the committee advertise for a "haunted house," oue whose reputation is well authenticated. The "Londoners," are looking with much interest for the result of the proposed researches of this association.

Wooden vs. Iron Ships.-An ordinary iron ship of 1,000 tons internal measurement will carry a dead weight cargo of 1,500 tons, while a wooden ship of the same internal measurement will carry only 1,463 tons, 27 tons, or two per cent less than the iron ship. The iron ships will weigh 775 tons, while the wooden ship weigh 1,000 tons. The former displaces 2,275 tons of water, while the latter displaces 2,473 tons.

The Swiftest Steamboat ever built is said to be the Mary Powell, running between New York and Poughkeepsie. She lately made the run between the two cities at the rate of 25 miles an hour, running time.

The Pole attracts magnets, but our glorious country attracts thousands of Poles.

Tabor \& Hili, Real Estate Agents and Stock Brokers, place their card in our culumns to-day. Messrs T. \& H. are members of the S. F. Stock \& Exchange Board and San Francisco Board of Brokers. Any business entrusted to their hands will be promptly and faithfully attended to. They may be found at 502 Montgomery street.

Mrityg Agexcr.-By reference to our advertising columns it will be seen, that we have made arrangements to obtain special information, through a resident correspondent, with regard to auy particular mine at Recese River. Parties in the city about to invest it "feet" in that neighborhood, and not having time or caring to incur the expense of visiting the locality, will do well to a rail themselves of the opportuvity hereby presented securing reliabls information, previous to investment, at a moderate cost.
Persous already holding "feet " and desirous to learn through a disinterested source the actual condition of the mine in which they may be intorested, will do well to embrace the opportunity here presented of securing the desired information.
We shall establish agencies similar to the above tn all
the principal triniug districts, at an ently the principal maining districts, at an early day.

The publlention of the Binmo and Sctemima Pabse will herenfter bu oondmeted by the firm of Dew EY de CO. C. W. M, Smitu, W, B FukR,
San Frapciseo, Dec. 18t., 1863.

## TERMS OF SUBSCIPTIONS.

Upan ealargiog our sbeet, we have determined to adhere stearily to the advance poyment for subscriptions, aud shall make ouly n slight advam ous ald pricen. Our rates, hereafter, will be at follows:--For one year, so sirmonths s3. By city carrint: 50 ennts per month.

## OUR NEW ARRANGEMENTS.

By special notice it will be obserred we have associated with us in the publication of the Press, Mr. A. T. Dewey, of La Parte, Sierra county, who has been connocted with the Mountain Messenger, as publisher, for the past five years. We shall now be enabled to carry out out long cherished plan of enlarging the paper, and the friends of mining and mechanical industry may rest assured of soon receiving a jonrnal in every way worthy of their representation and universal support.

## MINES AT SALT LAKE.

The Union Vedelte, the "Soldiers paper," published at Camp Drum, Salt Lake, contains the following account of recent mineral discoveries in Utah:-
Evidences of the vast wealth concealed in the mountain ranges of this Territory accumulate daily. In the Wasacth on the east, and in the Oqurrh or West Mountain range, silver, copper and lead have been discovered. In Bingham Cañon, in the latter range, ledges of silver and copper are now being worked, and before Spring, both raints and soldiers will be amazed at the rich developments. On the west, at Deep Creek, at Antelope Springs, at Egan Cañon and Ruluy Valley, ledges of silver equal to Reese River and Washoo have been discovered, prospected, and some are being worked. On the north, at Butte Creek, placer gold mines are paying the Morrisites richly, and at Hickman's Butte a whole mountain of cinnabar has been discuvered and will be worked in the Spring. Still further north, on the Snake River and the Blackfoot, gold digg ngs equal to the Boise and Bannock have been worked all Summer. In fact the whole Territory is one vast deposit of rich minerals, only awaiting industry and intelligence to develop it.

Taxing the Mines.-C. L. Strong, Esq., Superintendent of the Gould \& Curry claim, was before the County Board of Equalization to-day for the purpose of having the taxes of that claim equalized. The Board bad assessed the improvements on the claim at eight hundred thousaud d ilars, but Mr: Strong infromed them that they might tax it three hundred thousand more, and the company would be satisfied, which they did-so this one claim is assessed at upward of a mil lion of dollars; and yet there are mev in this 'Territory who insist that the mines do not bear any portion of the burdens of taxation. One such fact is worth a million of shaliow sophistical arguments, whether they eminate from judge, lawyer or loafer.--Virginia City Bulletin, Nov. 30.

The ship Lizzie Moses, for New York, takes 200 tons of Napoleon Copper ore.

San Franelson Twenty-one Years Ago.-A. G. Toomes, Below the Arlantic. -Soundings ith the Atlantic have of Elder Creek, says the Cell, who lived in this city during been particularly pushed forward, and have excited, on acmost of the Summer of 1842, fumishes the Red Bluff Bea. count of the telegraph cable, more general interest tham any con with the names of the pupulation of Yerba Buena (now other yet taken. They have revealed the fact that two hutSan Francisco) at the time. They are:
dred and thirty miles from the roast of Ireland the water
William Ray and wife, of the Hudson Bay Co., and three is still shallow; or in other words, that there is another Ireemployees; N. Spear and wife; Onptain Hickley; Mr. Davis, land only waiting to be raised-thus reversing the famulus a blacksmith; Robert Davis; Dapel Still; Mr. Viogel; Peter panacea for keeping the country quiet. It is just beyond this Sterreback; J. Fuller, wife and three children; Messrs. Teal that the true Atlantic begins; the gulf suddenly sinks to \& Titcomb; Mr. Limantour; Mrs. Inıa Briones and daughter; nine thousand feet. "Thus Ireland may one day have a coast Mr. Rock; Juan Padillo; R. H. Thomas, and A. G. Toomes. Iine as high as the Alps. The whole floor of the Atlantic is The number of buildings was thirteen.

What a change! In twenty-one years the little hamlet of consisting of very minute animals. many of them mere iump twenty-seven souls and thirteen buildings, has grown to a of jelly, and thousands of which could float with ease in a city of ome hundred thousand people and thirteen thousand drop of mater; some résenbling toothed wheels; others, buildings. Of the inhabitants that were here in 1842 , we only bundles of spines or threads shooting from a little globule. know of six now in existence, viz: Robert Davis, at Hono- Some, however, are endowed with property of separating flint lulu; Limantour, in Mexico; Mrs. Fuller and two of her from the sea water-which is more than every chemist could children, in this city, and Mr. Toomes, of Elder Creek.

Who are the Happy?-Lord Byron said: "The mehanic and working men who can maintain their families, are, in my opinion, the happiest body of men. Poverty is wretchedness, but even poverty is, perhaps, to be preferred to the heartless, unmeaning dissipation of the higher orders." Another authority says: "I have no propensity to envy any, and, least of all the rich and great; but if I were disposed to this weakness, the subject of my envy would be a healthy young man, in full possession of his streugth and facnlties, going forth in a morning to work for his wife and children or bringing them home his wages at night."

Calitoria Rozen for tue East.-This new article of California export, says the Evening Journal, appears to be assuming quite a prominent stand among the products of the State. The bundred barrels for New York by the William Cummings is the second shipment, and the difference between the cost here and the price in the East promise the shippers a handsome profit. California rosin costs at home $\$ 15$ per barrel; the price it brings in New York is $\$ 45$ per barrel. The resources of this State for naval stores add an additional importance to her relationship with the Govern ment during the existence of the war.

An Incidentar Good.-A Boston paper says that if Exchange will only hold good at the present high figures for a few moaths, we shall manufacture many articles which we now import. A gentlenad in New York has recently imported twelve French families from Lyons, who are -killed in the manufacture of velvets, with the intention of starting a man ufactory of first-class velvet in this country. The Waltham Watch Manufactory has made us independent of Genera and the Portsmouth Mills will soon enable us to do without Coates \& Taylor.

Irish Moss has been frund growing abundantly on the ocks along the beach in .Scituate, Mass., and about three thousund barrels are gathered manually. It is worth at first hande from five to six dollars per barrel,
do; and there are hundreds of square miles covered with the skeletons of these little creatures. Part of the ooze is doubtless from the clouds of rain-dust which rise from the vast steppes of South America in such masses as to darken the sun, and make the animals fy to shelter, and which, after sweeping like a simoon over the country, lose themselves in the 'steep Atlantic.' No bone have been found of the large , animals,. so that the kraken and sea serpent might sleep their last sleep, and leave not a bone or a vertebra to tell the tale. Not a mast or anchor, not a block or stran, not a coin or a keepsake, has been found to testify of the countless gallant men, who have gone down amid the pitiless waves.-All the Year Round.
Tae First Sawmill.-The old practice of making boards was to split up the logs with wedges; and, inconvenient as the practice was, is was no easy matter to persuade the world that the thing could be done in a better way. Sawmills were used in Europe in the fifteenth century: but as lately as 1855 an English embassador, having seen a sawmill in France, thought it a novelty wbich deserved a particular description. It is amusing to see how the aversion to labor saving machinery has alwayis agitated England. The first sawmill was established by a Dutchman, in the year 1663, but the public outcry against the newfangled machine was so violent that the proprietor was forced to decamp with more expedition than ever did Dutchman before. The evil was thus kept out of England for several years, or rather generations; but in 1693 an unlucky timber merchant hoping that after so long a time the public would be less watchful of its interests, made a rach attempt to construct another mill. The guardians of the public welfare, however, were on the alert and pulled the mill to pieces.

The effects of narcotic poisons seems to be destroyed by pouring cold water on the face and head. A girl, accidently poisoned in England with laudanum, had had all the usual remedies administered without effect; when cold water was applied, however, she breathed more easily and bled from the nose. The treatment with water being suspended, she relapsed into cous; being resumed she again rallied and in 60 hours was completely recovered

## [From our Traveling Correspoudent.] COPPEROPOLIS.

Mr. Editor:--I am happy to state that our exertions to bring this rich country into proper notice, and raise it to its legitimate rank, are meeting with success, as well as giving satisfaction. I am daily in receipt of letters from the Bay and country congratulating me upon the manner in which I have carried out your instructions. While this is the case, I shall be content to fulfil my mission to the end, though involving considerable labor, expenses, and inconvenience. I am also happy to state that Mr. Handy of San Francisco is now following me, taking a survey of the mines, with a view to publish a map of the copper district, which will be of immense value to the public. Mr. H. is the surveyor of the Stockton Railroad to Copperopolis via Kuight's ferry, the importance and neer ssity of which I shall have to speak more fully hereafter. He has politely requested to make use of my letters, which I readily granted, feeling assured of your compliance.

In my last letter I stated the mines north of Copperopolis were so numerous and far apart that I was obliged, at that time, to confine myself to those around Campo Seco. We must start once more, therefore, from Copperopolis, north of Salt Spring Valley, commencing with the Keystone.
Whether this name was given to the mine by accident or design I cannot tell. It is, nevertheless, peculiarly appropriate, for without doubt, it is the keystone of the most magnificent and imcomparable, copper discovery in the world, fabulous alike in richness, extent, and permanency. When, in Cornwall, the Stephenson Consolidated lode stood developed for seven miles. It ranked for years the copper wouder of the world, paling its grandeur only to the dawning genius of Australia with her Burva Burra and Capunda, and now how absolutely insignificent are both of these systems? Here today, in a country unequalled for climate, scenery, facility of transit, and every other attribute of human happiness and success, stands the old Keystone, the centre of a copper system, reliably developed north and south from Mariposa to Nevada, one hundred and ninety-five miles, and embracing its parallels for twenty-five miles wide. One hundred years hence, and what mind can foreshadow its effects upon the elevation of the State and nation? And when this glorious valley, with its grand, broad, level sweep, from the Stanislaus to the Mokelumne, thence to Ione and the Cosumnes, is a mighty net-work of great cities, and private villas, what a histronic spot the Keystone will be! May we not suppose that the people of that day will trace upon some old bronze monument, made from its own ore, which will no doubt then raise its head to heaven, the names of Read, McCarthy, Ryen, Mendeville, Aitkin, Powning, and in memory of the orignal discoverers of this, even now famous lead?
Some may think, perhaps, this is an exagerated introduction. Before I get through I shall show it is not. I am a great believer in copper, and I am still a greater believer in this particular system. Let us see if I am right, and the Keystone worthy the reputation I have given it. The claim contains 3,300 feet, divided into 3,300 shares. There are three shafts respectively 320,50 and 150 feet deep. Through the myateries of these I was politely piloted by Mr. Richard Powning, or Capt. Dick, as he is familiarly called. I shall begin with the upper or north shaft, 320 feet. In this there are seven drifts running in opposite lines, with every other requisite for convenience and expedition in work. The lead in the bottom drifts, running in 40 feet, is nine feet wide; containing three feet No. 1 ore, six feet No. 2; the latter averaging over 12 per cent. The next level above, at the depth of 200 feet, drifts and ores about the same. The next level, with longer drifts, shows the vein ten feet wide; six inches No. 1, the balance, No. 2 ore, having already beeu taken out. In these upper levels there are thousauds of tons of No. 2 ore, hitherto neglected, but which being concentrated, in the new works now on the eve of completion, will alone be a fortune to the company. This shaft is 500 feet below the northern line, where it joins the Consolidated. Some 2,000 feet down towards town stands the old discovery shaft, 50 feet deep, with a drift 40 feet long, Here the vein is nine feet wide, 2 f fet of No. 1 , aud 7 ft . of No. 2 ore. Then 500 feet lower down again, 17 feet off the Union line, is the third main shaft, 160 feet deep, with two drifts, eleven feet each. Here the vein, at the bottom, is 12 feet wide;
four feet No. 1, eight feet No. 2 ore. On the next level, 50 feet above, the side drift 150 feetlong shows the vein two feet wide, equally divided into No. L and No. 2 ores. The opposite drift runs into the side claim east, called the Inimitable, leaving an 18 feet horse between the two leads, and shows that veiu 13 feet wide all N N .2 ore, but averaging 15 per cent. This runs 20 feet on the vein. On the next level, 50 feet higher, a dritt runs 15 feet on the vein, showing pretty much the same results, In this shaft there are also thousands of tons of No. 2 ore ready for stopeing the moment the conceutration works get under weigh. There are also some other "prospecting shafts" down in different parts of the claim, disclosing equally tavorable results, but which would be tedious and unneeessary to particularize.
The concentration works, on the eve of completion, (being expected to start next Saturday) form a very distinguishing feature of the Keystone. They are, I believe, the first of the kind in America, certainly in California, and throughout are of the most substantial and first-class character, reflecting the highest credit on all concerned. They stand about 1,800 feet from the uppermost or northern shaft, from which a rail is laid to bring the ore down to them. In machinery they embrace every modern compliance and improvement. 'The entire building is 200 feet long, 30 feet wide, and gives an immense business appearance to the town. The engine is 40 . horse power, of Donahue \& Co's?lbest style. Of its effectiveness you may judge, when it is intended to pump from two shafts, hoist from another, run five jiggers, and all the various machinery connected with the entire works, It is true these works involve a large expense; but then, we must remember, besides the immense outside time and labor they will save the company, by reducing all the No. 2 ore, and freeing it from every particle of refuse rock, they raise the value of every ton of that ore from 12 to 18 or 20 per cent. After a careful examination, I rate the capacity of the Keystone at 550 tons per month.
I cannot close this account without paying Capt. Dick a tribute of praise he deserves for putting the mine in its present auspicious condition. He has unquestionably a thorough knowledge of copper mining in all its branches. If the company will only be patient, leave him alone, and let him stope up his ground clean as he goes, they will not rogret it, when the ensuing year closes upon them. It is only just to say that Capt. Dick has lately also done equally good work on the Caleveras claim. Next in succession, proceeding up the valley, comes the

## consolidated.

This claim contains 1,800 feet divided into 1,800 shares. It adjoins the Keystone, being located at the same time, and is apertension of it. It contains three shafts, respectively of 18,70 and 40 feet. It is, however, by no means developed, though presenting many favorable indications. In the 70 feet shaft, there is the strongest body of mundic I have yet seen. I confess my patriality to mundic, and think that copper will be struck sooner in this shaft, than in the one of 40 feet, where the blue slate is strangely impregnated with yellow sulphurets. Work is suspended until next Spring, when machinery will be put up. Next comes the

```
great western.
```

This is also an original location, containing somewhere abnut 1,800 feet, divided into 13 shares. This claim lies idle, I understand, from want of capital, no other work being done than what is necessary to representit. Following this c!aim are several others, which, as they are simply locations, and in the same condition, it will only be necessary to mention. They are the Salt Spring Valley, the Masonic, and the Jefferson. From here, some distance up the valley, it will be very difficult to locate the lead. The best advice I have heard given, is tbat of the Cornishman, who suggested the propriety of sinking 500 feet, and then drift north, south, east and west. I think it likely the lead might be struck under those circumstances.
We are now supposed to be some three miles from the Keystone, when we leave the valley to the left, and going up the Bear Mountain range some half mile, or more, reach the croceett.
This is quite a celebrated claim, opening beautifully, with an established vein of splendid ore. It is a distinct vein going to the east side of Bear Mountain from Copperopolis town. It contains 3,150 feet, and is incorporated. The mine is now fized up for permanent work, and will develop
itself rapidly, A short distance from the Crockett, bearin $g$ east of south, is the
bear mountain.
This claim is still undeveloped, and suspended for a time. It is on the same lead as the Crockett. It coutains 3,000 feet, divided into 20 shares. Work to be recommenced in the Spring. Passing on in an almost easterly course over the hills we come to the

This is also a celebrated mine, but has fluctuated up and down more, perhaps, than any other in the district. It is not on the Crockett, but runs east of it. Occasionally excellent ore was taken out, but nothing permanent. It was originally called Beauregard; the two are now consolidated. The claim contuins 3,250 feet, divided into 200 shares. It unquestionably opens in beautiful style, carrying carbonates and oxides from the top, with rell developed walls, at one time 20 feet apart, but now compressed to 9 feet. There is considerable gossan on the surface, quite auriferous. The rock, however, is still heavy, and corrupt, carrying copper and sulphates of zinc certainly; some say silver; of the latter I am no judge. At the request of Mr. Garrard, the Supt., I spent half a day with him here and at last found a vein of better ore than they have ever had, about a foot thick. This was in the side drift. Twenty-five feet more put on the shaft, I feel certain, will open a three feet vain. I beg to acknowledge the polite attentions of Mr. Garrard's family, and hope for their sake the Antelope will come out right. I think there is no fear of its not doing so in the end.

I must now take jou, at least six or seven miles along the Angel's Canp round, to within sight of Altaville, to clains I visited on my arrival here, but which I could not notice before without confusion. I hope the Colnor boys will accept this appology for it is the fact. Turning into the woods some distance bejond Hiuckle's ranch, are three claims, though I cannot pretend to locate the system they are on. The first is the

## еmamett.

"This claim contains, 2,200 feet, divided into 11 shares:' The main shaft was down 50 feet thea, now I suppose considerably more. The rock carried iron largely, but sufficient copper to make it goad ultimately. Our lucky friend Elinore is concerned in this claim, so it is sure to turn out well. I hope so. Adjoining the Emmett is the extension

## rising star.

This claim contains 3,200 feet, divided into 16 shares. They are not doing much until the Emmett gets down. This claim, however, lying as it does between the Emmett and Colnor, I think it must be a safe thing. Next and last iu this direction is the
colnor.
I find my notes have become somewhat obscure, but I think the claim contains 3,200 feet divided into 16 shares. The old shaft had to be abandoned as it dipped to much in the hill to be workable. The new shaft, very well put down, through immensely hard rock, must now be down about 100 feet. This is the claim I meationed in my first letter of the Stockton Fair, as having such splendid specimens there. The rock in its formation is very pure. I should like to see this mine agaiu if possible, and as I go to Angels to see about your own claim there, I shall endeavor to give the boys a call. I have great faith in the Colnor.
L. H.
A. London professor lectureả recently on adulterations of food. He handed around coffee, which was pronounced excellent, then told the audience that they had been regaled with a mixture of bullock's blood and, chicory, sheep's liver, dried and old coffee grounds. He gave them capital porter too, made of spirits of wine, gum arabic and burat sugar.
Dried Ur.-The Rocky Monntain News says: The Platte is not the only stream that has entirely failed this season. The Arkansas is entirely dry for two or three hundred miles. The Huerfano, and other large tributaries coming into the Arkansas from the South, are also dry. We presume that Red River, and other streams of the South, are in the same condition. In Utah, and further North, water has never before been so scarce sioce the country was known.

Some idea may be formed of the tremendous effects of the powder magazine explosion at the foot of Seventy-ninth street, N. Y., from the fact that a steamboat traveled all the way to New Haven on the Sound

Macinamary for Owes's Rrier.-Four or five teans, heavily louded with quartz mill machinery, (sitys tho Rismerakla Times, of Nuvember 2ith.) itestined for Owen's liver country, frassed, through tuwn this morning. Public attention is rapldly turuing to the above section, and a big rush will bo made there in the spring. Parties are going from here nearly every day. The confidence shown in those sending down machinery for mills is not without cause. That section is undoubtedly rich in both mineral and agricultural wealth.
-It is found by investigation that the number of men who have been actually killed in this war dues not fall shurt of half a million.

TO QUARTZ MINERS,

#### Abstract

Al persons interested in Mining ira Acbiuery are myited to callat Dounhue' Foundry abd axamine nyy improved Amaigamator. It is unquestion Silver and Gold. It works 1000 prunds at a time, and will amalgumate over three tolns a day. By the molion or the revolving mulldr, the pulp is drawn through its or the revolving mulldr, the pulp 18 drawn through its centro add passes under it, between the grinding surcentro and passes ubder it, between the grinding sur facce, to the circumference; from whence it passes again tweon the grinding surface to the circumference as before. Thus a coostant circulation of the pulp is kept up, bringing the particles of ore again and again under the bringing the particles of ore again and again under the muller, and reducing the whoie mass to an impalpable muller, an powder, Noquicksilver lies betseen the surfaces to be ground but at the circumference and centre of th" pan where the aretal must pass through it as the pulp circulates. A natent was granted for this Amalgamator in A patent whe granted for this Amalgnmator in De cember last, and all persons are again warned aganost purchasing machines made at the Mincrs' Foundry called "Wheler's Amalgamator'" as they are an infringensent on my pateut, and a suit is now pendiug In the U. S, Cir cuit Court aganst the parties infringing. My Amalgamators can be seen ruving at Donahue's Foundry, where all can judge of their operntion and the very superior all can juige of their operntion and the very superio style in which they are boing manufactured THOMAS VARNEY.

THE DEBT AND RESOURCES OF THE UNITED
The Banker's Mragazine for October last, contains a care fully written article upon "The Debt and Resources of the United States," and introducing therein a comparative statement of the credit of Great Britian and the Federal Government, in their respective tinees of trial. We condense as follows :

The normal prices of the British 3 per cents being 93, and standing always above 89 from 1730 to 1745 , they fell during the Scotch rebellion of 1545 , to 76 ; at the close of the American war ( 1781 ) to 54 ; in 1797 to 473 ; and in 1854 (Crimean war) to $85^{1} 8$.
The United States 6 per cent. 20 year coupon bonds were at 89 to 92 in Septenuber, 1861 ; in April, 1862, rose to 98 ; in Juue to $105^{1}$; fluctuated between July and December, from par to 104 ; and from January, 1863, to A pril, varied from 90 to 1061 .
The price of gold in the respective markets presents the following relative ranges
In the English market gold was above 25 per cent. premium for three years from 1811 ; for two of those years above 33 per cent; one jear and a guarter abore 36 , and at 411 , from November, 1812, to March. 1863.
At New York, fire months aiter the suspension of specie paywents. gold was at 4 per cent. premium; during three and a half months, from 3d July to 2uth October, 1862 , it was under 30 ; for two months after, above 33 ; from 1 st of
January, 1863 , to $3 d$ of March, fluttering from $331 / 2$ to $721 / 2$; January, 1863 , to suich it went down to 45 on the Ist of June.
This history, considered with reference to the respective conditions of the two nations, is all in favor of the Federal Government: A comparison of our present credit with that of our own Government in former exigencies, is even more sarprising. The loans of 1799 and 1800 were sold at a discount of 17.20 per cent; those of 1813 at 12 and 11.75 those of Mareb, 1814, at 18.86; and the total of the discounted loaus 1799 to 4th March, 1861, at an average divcount of 12.55 per cent; while the total of the present secretary's loans sold under par, calculated. upon the par of 6 per cents., fall to 5.9 per cent. average discount. On a full review of all the facts, are we not saie in saying that in the very midst of this hurricane of civil war, our Treasury is in smouth water?

## dnted states currency.

As in case our National Debt, we wre best able to grasp and understand the question of our currency, by comparing its present condition with that of the curresponding periods of English history-a history tbat worked itself int, issues so well understood that re may readily see the facts of our own case, and forecast the results by the light thus affurded to us.
The figures that did the service of reducing Joln Bull to
despair in 1815 , stood thus, according to Mr. Lloyd, who is despair in 1815 , stood thus, according to Mr. Lloyd, who is received as the best authority in this branch of statistics:
Bank of England notes and local bank circalation of the three Kingdoms: $\$ 004,000,000$; Exchequer Bills, $\$ 202$, , 000,000 ; Postal Circulation, $\$ 706,000,000$.
This amount, at the then population of Great Britian, gave an average of $\$ 37.16$ per capita.
When the wealth of England was but $\$ 10,400,000,000$, the circulation was four times greater than in 1844-51, when the wealth was more than double that of 1815, or in relative amount; full eight times greater. Here was abundant opportunity, and no slight apparent warrant, fo an outcry. pensès and subsidies paid slbroad. Bonaparte held the opinion that sle must succumb when reduced to an utterly redemptionless note currency. The opponents of the government, the bullion-heads, and the whole body of alarmists and despondents held the same doctrine.
The famous Bullion of the House of Commons sustained it ; arguing as ably as the best of our Democrats, for a cash, and against a credit, circulation; and recommending ai instant return to cash payments, without regard to consequences, or any respect to impossibilities.
Now, let us see how our greenbacks and other currency compare-not with the assiguals, nor eren with the "Continental money", of our Revolution, but with "the depreciated and depreciating" Bank of England notes, every dollar of which was at their par of gold, three years after they were at their worst.

## the bank note circulation of the dnited states.

The bank note circulation of the United States, from 1852 to 1859 , eight years, averaged $146,000,000$, making $\$ 906$ per capita. On the 1st of May, 1863, the bank circulation of the loyal States (assumed to be the sam - as in December last) was $\$ 168,400,000$; the United States notes and fractional currency $\$ 394,920,950^{\circ}$. To these add one year of indebtedness, which may be taken to correspond, in the way of circulation, to the Exchequer bills of England, which amount to $\$ 142,750,000$-a grand total of $\$: 06,070,956$.
Thus it appears that our total circulation, in 1853 , is exactly equal to that of Eigland in 1815-our wealth threetenths greater, and onr per cayitra circulation more than onefith lessio Moreorer, their circulation quadrupled their ofro average of a muchlater date; ours slightly more than trebles our average of a period of three yeare gone.

Our inflated currency, so lar as th banks are concemed, does not exceed our average in specie-paying times more
than twenty-two milliwns, or filteen pel cent. As to the than twenty-two milliuns, or filteen per cent. As to the
greenbacks, the bistory of the twenty-five loms, in ibe month of May. shows that the Becretary cau find any surplus of them in circulation, at the rate of two millions a doy $;$ or, if he were in a harry, by calling for bids he could do it, at twenty latys' notice, at once, which brings us to the conclusion that the day on which the war cluses, will be just the day belure the resumption of specie payments, to all intents and purpuses. The suspension of specie payroents lasted twenty years in England. Her Bullionists bravely. for all those twenty years. in the very teeth of the facts, declared that a purely credit circulation conld not be maintained, and under favor of war prices and speculatiorn in gold, kept up the cry of "depreciation" to the bitter end.
Taking it for certain that this piece of history must get a rehearsal among us, we content ourselves with lurnishing the material for better opinions, to better men, and precedents and forms of despair to those who must beeds see things the way they don'tlise them, and don't like to see things just the way they are.

Wicks for Kerosene Oil Lamps.-One of the most frequent causes of the bad burning of mineral-oil lamps, says the American Gas Light Journal, arises from the employment of damp wicks. Cotton, like most other regetable fabrics, readily absorbs from one fifth to one-sixth its weight of moisture from the atmosphere; this prevents the free ascent of the oil, and leads to charing of the wick, and the produc tion of an-imperfect flame-hence, it is exceedingly important that a new wick should be thoroughly dried before it is placed in a lamp. When it has been once saturated with oil, the further absorption of moisture is prevented The trouble of holding a wick before the fire till it ceases to give out auy vapor is so triffing as not to be taken in consideration, and the nprovenent in the flame and regalarity of buruing is cousiderable.

The Pacific Montuly has again changed Editors, and is now under the management of Lisce Lester, a lady who has recently arrired anong us from Wisconsin. Tue new editur is not without experience in her profession, having loug been favorably known as a writer of decided ability, She has at different times edited several monthly and other periudical publications, in which positions, as well as in miscellaneous newspaper correspondence, sle has displayed marked talent. The magazine before us, though but partially prepared under her charge, exhibits a taste and genius which is eminently promising of fature success. We extend to her a cordial greetiug, and our best wishes in her new field of labor.

The Golden Age, Reese River, is now down about sixty feet, with a four foot vein; One hundred shares have changed hands during the week-principally at private sale; prices varying from $\$ 30$ to $\$ 65$. We notice quotations of the Stock Board at $\$ 30$. These shares are principally sought after by Reese River mill men and speculators from that region. A very fine specimer of chloride of silver ore, from this vein, has been left at this office, and naving been subjected to the heat of a furnace, is completely covered upon one of its sides with globales of silver. The stockholders know, beyond a doubt, that this vein is rich, and heace the reluc tance on their part to dispose of the shares.

Tere most remarkable blast in the history of iron mining took place at the Lake Superior mine a short time since. In ordinary ones but one and one-half inch hote in diameter is drilled, but in this case, one of four inches, and eighteen feet deep was made, distant from the edge of the cliff about ten feet, into which one keg of powder was pat und exploded as preliminary, and which had the effect to open a seam to the depth of filty feet. Sixteen kegs of powder was then put in as a final charge, which threw down over 3,000 tons of ore, so completely broken up that the largest portion was small enough to luad on the cars for shipment without further re-duction.-Marquette News and Journal.
New York will soon be defended by eight hundred pieces of the heaviest ordnance. A gentleman who has recently passed through the large new fort near the Narrows, informs us that he counted fourteen guns described as three-hundred pounders, and that the bulk of the armament consists. of twelve-inch and fourteenuinch guns. Platforms were being laid for fifteor-iuch and twenty-inch gans.

## MEXICAN MINING ITEMS.

The schooner Mary Cleveland cleared, on Saturday, for Ventana Bay and La Paz; in Lower California, Her freight consists of machinery, lumber and mining tools for the Santa
Cruz, La Marroneua and Pena silver mining companies in San Antonio District.
The mines in this District are of the most permanent character, and will compare favorably with the best of the Mexiean mines; the ore being very rich, the maines wide and freight ch ap to and from this city.
The District of San Antonio is fast filling up with Culifornia miners who have already developed about sisty mines; and as they have to rely upon the city of San Francisco for tools and machinery, the recent, numerous shipments of these articles to that place, and the beavy shipments of ore from there to Swansey and Freyburg, and the fine, large samples of rich lumps or specimens forwarded to this city, have made this st ek much sought for in this market. The block of metal at 411 Clay street, sent up from the Marreneuo mine, gives abundant evidence of the strength and permanancy of that mine. Eastern capital, at the present time,
appears to prefer Mixican mines to the less extensive appears to prefer Mixican mines to the less extensive and nore uoreliable veins in Washoe.
The Sieria Nevada, which cleared on Tuesday last, for Mazatlan, La Paz and Cape St. Lucas, took away not only s:x hundred tows of nining implements, but several of our
most able metalurgists, who go to examine the northen most able metalurgists, who go to examine the northern mines in Sonora.
The most of the mines in Lower California and Sonora have passed into the hands of California capitalists within the last year, and many of then are now taking out large quantities of silver and have bundreds of tons of ore now ready for shipunent. In Lower California the ore is Melal cle Fuego, or fire metal, and it is found cheaper to ship it than to assess heavily for machinery to work it on the ground. We are warranted in sayiug that the lowest return of ores from Lower Salifornia to Frieburg wat $\$ 147$ per ton; and the sum total of shipiag, freight, working, commissions and extracting the ore is ten dollars per ton to talke it out of the mine and place it at Veatano Bay, ( 18 miles from the mines) ; $\$ 12$ per ton from there to Frieburg ; $\$ 18$ to work the ore in Frieburg; $\$ 5$ for railroad and municipal duties, and 1 per ceut. commission-m king $\$ 4650$ per ton ; leaving a clear profit of $\$ 100$ and upwards per tón, ou the common ores, and much of it will double this sum in profit, as the late tests will show. Tests of the Triunfo, Guosane, Santa Cruz, La Marronena, Maria, Picacho, San Antonio. Pena and Caruzallita mines which have recently been made, yielded from three hundred to five hundred dollars per ton

The " Dick Sides," or "Sides" as it is now generally denominated, bave commenced suit against certain parties in Virginia City, who have "squatted" upon their ground, for passession of the same for mining purposes. The question of the occupation of mining ground in that city, for building purposes, is becoming a very embarassing and important one. In the present instance, we are indirectly cognizant of the fact that a "written notice" was given to the parties who put up the first "squatter's improvemen t" upon their ground, that the company claimed, under the laws of the District, 100 feet on each side of their ledge, from stake to stake, for mining purposes, which claim was acknowledged by the parties in question, who owned the building that was subseqnently known as the "Old Mormon Theatre," and who at the time agreed to remove the same whenever the ground was needed for mining parposes. A smbsequent possessory right of this description upon mining ground must be very precarious as the Courts have ever been liberal to miners in their allowance of ground for mining purposes, as indeed, they should be.

Franking. - No private citizen, high or low, can send a letter or document of any kind; or any other thing, to any of ficer or public man at Washington or elsewhere (excepting to members of the United States Seuate and House of Representatives, the Secretary of the Senate and Clerk of the House of Representatives,) withont prepaying full postage thereon, whether such matter is upon official business or otherwise. He must prepay letters to the President of the United States, his Cabinet officers and all others in public stations with the above exceptions.

## MINING SEARE MARKET.

Notwith standing the lack of adviops of new developements during the jrast week, and the greater caution which, of late, enaracterized the action of buyera, it wil bo seon by our falling off in the amount of business transacted.
Ophit shares still continue to be liberally dealt in. Prices juring the woek have buen sumewhat fuctuating, but generally at improved rates over last quotations. A dividend of B60 per fout was declared to day.
Grould \& Curry shares are held firmly at $\$ 4, \overline{2} 00$, with mall transactions. A di idend of \$125 per foot was declarad on Wed esday, and a large surplus carried over to meet curtent expensus of iaprovements now in progress at the Company' Works.
Savage shares are inactive, being held firmly at from $32, \pi 50(\hat{n} \$ 2,55$. A dividend of $\$ 50$ per foot was declared on Thursday, and a handsome balance carried over to the fompmen's sinking fund-a fund which the company is grad hally accumulating for the erection of Reduction Works, etc. Burning Muscum still continues to form the chief specuative feature of the Board. Eight hundred and fifty four ares have changed hands during the week, at fluctuating ates, closing at a decline over last quotations.
Chullar shares have been freely offered at a decline of $\$ 60$ this depreciation has been produced by the call of an as essment of that amount per foot, on the 3d instant, and gable forthwith.
Lady Bryan was in great demand early in the week, in conequence of reports from the mine that a valuable and heavy ein had been found. Shares rapidly advanced from $\$ 10$ to bl 6 per foot. No confirmation of the strike being subse pently received, shares declined to $\$ 11$. Seven mundred and inety-four shares have changed hands during the week.
Baltic has been considerably dealt in at advanced rates.
Hale \& Norcross have been cousiderably sought after at 92. - -holders firm at $\$ 1,000$. No transaction reported. Potosi has met with slight sales at $\$ 900$. Grass Valley lares have been freely offured at $\$ 50$, with but few buyers. orth Potosi is quoted at $\$ 32$.
Sierra Nevada shares have a market at $\$ 90$. Daney is in mand at from \$100@\$105.
Uncle Sam has recuvered from its decline of last weekacy now be quoted at \$440.
North America and Baltimore American have slightly delined.
Bullion (Gold Eill,) closed dull at a decline.
El Dorado has met with a slight advan"e. Buckeye is uoted at $\$ 12$; Lafayette, (G. H.) at $\$ 10$; Burniide, $\$ 5.500$ antiago in demand at $\$ 16$; Madison at $\$ 25$; Bajazet, $\$ 12$ Tnion, (G. H.) \$8.
Sheba opened at $\$ 140$, advanced to $\$ 160$, and closed at 145.

Melones have been in considerable demand, and reached 110, at thirty days.
Wide West shares remain steady at $\$ 65$. Late reports om this mine are of a favorable character. We understand hat they have again started their mill on their own rock.
Utah is quoted at from $\$ 4 \Omega \$ 50$. This company has now very strong lode. I'he rock is being worked at the Gregry Mill.
Antelope is quoted at $\$ 90 @ \$ 110$ : Real Del Monte at (400, and $\$ 475$ asked ; Ural at $\$ 40$; Bamboo, $\$ 25$.

WHEELER'S
Amalgamating and Separating Pans,
It is ncknowledged by all who have examined the prin-
ciples and withesped the ciples anll withessed the nperation of these Pans, that
thuy are decidedly superior for triturating and amalgathey are decidedly superior for triturating and amalg
mating purposes to any other in use.
The most important principle connected with the opoprocess from the tor exrractiug tho amalcam from the process from thet ca extractiug the amalgam from the
sand. The ohiet cause of luss of the precious metuls arises from the passing off of the same in combination with
tho quicksilver, during the proces of trituration, and iu tho quicksilver, during the proces of trituration, and in
clenning up By the ittroduction of The Separating Pan
to f llow the trituration this loss is eatirely workug the trituration this loss is eatires there is apootced.

Where these lans haye been introduced and onerated by the sude of otbers on ands from the same vat, the
Wheeler Pank have uniformly gained a farge percentage of metals over its compectitor, as well as a still larger

## VOL. VII. SAN FRANCISCO, MONDAY EVENING, DECEMBER 14. 1863. NO. 7.

## ENLARGEMENT AND IMPROVEMENT

of the mining and scientific press. satumay, jayuary 2. 1803.
The publishers are plessed to annouvee the enlurgament of this Journa on the 2d of Jaucary next, frum eight to eixteen pugen-double ata present size.

## NOTICE.

The publication of the Miniva Ave Scinstipg Press will herenfter conflueted by the firm of DEWEY \& CO .

San Framelisco, Dec. 1st, 1883. C. W. М. Sмirt W. I Emek,

## TERMS OF SUBSCRIPTIONS.

Upon onlarging our sheet, we kave determined to adhere atrictly to the advanco payment for Rubecriptions, and shall make ouly a shight advance on old pricem. Our raten, liereafter, whil be as follows:-For oue year, $\$ \mathbf{8}$; six months, 53. By city carriers, 50 cents per month.

## To Adverisers.

The circulation of the Press throllghout all the Mining Districte of this State and Nevada Territory, renders it a desiratile advertisiag medium for Mining Companies, Inveutors, Patanteur, Machlmate, Munufacturers, Build ers and Tradeamell. Terms rensonable and uulform.
(A). Avertisements for the first issue of our enlarged seriea, should banded in at at oarly day.

## Sacramento Agency.

W. B. Rice, at the bnok-store, 146 J street, between 5 th and 6 th , is ou Ageut for Sacramento city

Our Address
Parties addressing this ompe shuuld be particular to write the nan " Masing and Sctevmpic Press" in full, to avoill all liabilities of mistakes.

## OUR NEW ARRANGEMENTS.

By special notice it will be observed we have associated with us in the publication of the Press, Mr. A. T. Dewey, of La Porte, Sierra county, who has been connected with the Mountain Messenger, as publisher, for the past five years. We shall now be enabled to carry out our long cherished plan of enlarging the paper, and the friends of mining and mechanical industry may rest assured of soon receiving a journal in every way worthy of their representation and universal support.
A. Desirable Lapronkment, - Crocker's Stock and Assessment Ledger" is claimed to save Secretaries of mining companies a great deal of labor, and is a real assistance in keeping the accounts of shareholders from becoming com plicated. The pablisher's description will be found in our advertising columns, and a copy of the work can be seen a the office of the Prfss.

A Rare Cabinet of Minerals.-We were well reprid for a visit to Dr. Jos. M. Frey's office, at Sacramento, in a
brief exanination of his rich and rare collections of minerals, brief exaraination of his rich and rare collections of miner

Riversids.-This is the name of a new " city " just laid out in Keys' Mining District, Owen's River, ninety miles south of Aurora, and fifty miles above Bend City. Mr. ©. C. Scott informs us that the mines prospect richer than those of the Inyo District, and that they are surrounded by rich and healthy agricultural lands.

Pilot Knob.-A correspundent writing from "Pilut Knob" says that the Pilot Knob shaft is now down fifty feet, with high hopes of success at a depth of 100 or 150 feel. Our correspondent adds:-
"T'oo many around here get faint-hearted if they do not find copper near the surface. We prefer depth with continuation, to surface with pinching out and in. Many shafts are idle, awaiting the periodical excitement for more work There is a fine development of two leet of rich ore in Johnston \& Co's shaft, near the Aroyo Seco. They are persevering, energetic men, and deserve success. The Lima also is taking out ore; vein, I believe, 12 inches. Excitement has ruled high for a time, but sober business has now taken its place.

Reported Silver Discovery,-A correspondent writes from Mokelumne Hill, Dec. 5th., 1863, as follows:-I have just returned from the Stanielaus River, and vicinity of Melones, where I think another rich etrike has just been made by a company of Greeks. While prospecting for copper they struck a vein, about four feet wide, yielding sulphurets of copper and green and blue carbonates of copper, in which there is a large proportion of silver. A piece of choice rock taken from a depth of two feet, produced at the rate of $\$ 414$ per ton, while an average lot produced $\$ 302$ per ton. This assay was made by our friend Dr. James Hepburn, of this place, and was made for silver only. In a few days I may give you a discription of tie place, and its ledges, for pulication. The first chance I have I will send you a piece of this Greek rock for your cabinet.
R. W. D.

The Refse River Quartz Mills.-Correspondence, dated Austin, 28th of November, in the Virginia City Union says:
There are three mills here in this canon, and three more are being built; but they are pretty generally idle now, on account of the mill men and miners being at swords' poiats about the price of the crushing- $\$ 100$ per ton. The miners also say that the mills are not prepared to give proper return's as they have not a sufficient number of pans. Whatever may be the merits of the controversy, the disagreement exists, and its consequences have been injurious to the country, much retarding its development.
Mocu excitement exists in and about Salt Lake, uwing to new discoveries of good deposits of the precious metals. Gold and silver bearing quartz has been found in several localities. The Mormons, or at least the head men of Brigham's tribe, are in nowise pleased at the "strikes" being made. Yet prospecting continues daily, whether they like it or not. The "Saints" fear a rush next spring of hardy miners.
The annual freight bill of the Central mill in Virginia city is, we are informed, about $\$ 20,000$. This is for salt, cliemicals and such machinery and other things as the legitinand tear of mill make aecessary.
Tae Humboldt Register says, something like two miles above Star City is found a limestone bluff, having a bold, square front, like the lacing of a huge fort. In the face of this is the entranco to one of the grandest caverns ever yet explored. It has been partially explored.

Four Masted Sclooner.-An eccentric looking craft o this description is now freighting on the Sacramento river

Santa Cruz Petroleust. - The Santa Craz Petroleum Oil Works Company have worked wonders in the last two weeks. A road has been constructed to the Petroleum Hills, one building, designed as quarters for workmen is alrendy finished ; another, two stories high, and of larger dimensions, is almost completed. The brick, for boiler and engine, and for retort and still foundations. are already on the ground. If the rains do not very much interfere with the work, we shall illuminate Santa Cruz with oil from our own hills before spring.
The supply of petroleum and rock oil is giving out in the East. Many of the refineries in Pennsylvania and Cacada have stopped work for want of the raw material to work upon. Crude Oil has adranced in price from $\$ 1.50$ to $\$ 5$ per barrel.
There seems, in many places, to be a sudden exhaustion of the great reservoirs of oil; sometimes however the springs are intermittent, and resume their flow after a short cessation.
The Santa Cruz Petroleum Oil Works Company will not be annoyed by any intermission or exhaustion of their supply of raw material. The petroleum is all above ground, and in quantity sufficient to last a century. If by boring they should reach a reservoir of oil, that would be clear gain.Santa Cruz Sentinel.
Miners in Demand in Siekiyou County.-The Yreka Journal says that Siskiyou county is deficient in a supply of Mining hands, caused by the stampede to now places, and the dread of China competition. Miner's wages have increased twenty-five per cent., and mechanics' wages have also increased.

The Recrat Elfction in the Washoe Stock Exchange Board at Virginia resulted in the choice of R. M. Daggett, for President. R. W. Billett for Vice President. John McCarty for Secretary, and R. T. Smith for Treasurer, all of whom were elected by acclamation there being no opposing candidates.

The Commerce of tee World.-It is stated that the commerce of the world requires $3,600,000$ able-bodied men to be constantly traversing the sea. The amuunt of property annually moved on the water is from fifteen hundred to two thousand millions of dollars ; and the amount lost by the casualties of the sea, averages twenty-five millions of dollars.

Chicago Wood Patements.-The Board of Works in the City of Chicago have given the preference to wood pavements over those of stone, as being the most durable of any kind yet used there. The fullowing is a description of the method of construction: Lay down fooring of oue inch board on a bed of sand; coat the floor with asphaltum; stand on end blocks of wood six inches high, by three inches thick, and nine inches in length, in rows about one inch apart, divided by strips of boards. Fill in these open मarrow spaces with asphaltum. There are six niles of these pavements in Chicago, which after six years constant wear, aro found to be nearly as perfect as when laid down.

## [From onr Traveling Currespondent.] COPPEROPOLIS.

Mr. Edrior:- In collecting information as I travel from mine to mine, I hare nuted down several matters, which I suppose, may be called abuses, liecause they are uyjust to miners. These. I hold, your paper slould recognize, and correct, or at least in justicice tôitself, endeavor tó correet. Oue thing in particular, I find very injurious to the mines, and all classes with whom I have conversed upon it are ansious I should bring it forward.

Throaghont this copper country, there are many claims having a local value from five to twenty-five dollars per foot. These prices, outside stockholders, men of business, and shareholders laboring on claims they own in, are content to pay, and do pay all the time. In fact, quite an amount of stock, after this fashion, is constantly changing hands.At the same time not one of these claims could scll a foot at San Francisco for as many cents. Now this it seems to me is wrong, wrong in itself, wrong especially to the laboring miner. If men living in the neighborhood of a claim, or working, a claim, are content to give ten dollars a foot, be cause they know it is worth the money, being a marketalle article, it ought surrely to be worth the same on Montgomery street. If the brokers choose to make San Francisco the centre of the mining market, they must at the same time assume the entire responsibility, and not dictate what shall, and what. shall not, as their sovereigu pleasure wills, be offered for sale to the public. If the country must be governed by San Frarcisco, in return, San Francisco should be just to the country. The present system is a curse rather than benefit to the mining interest.
Let nue state a case in point. A company with limited means go down on their claim say seventy feet, and strike a vein which makes the stock worth ten dollars per foot in its neighborhood. They then require further ineans to prosecute their work, pay their bills and so forth. Money happens to be scarce in the country; San Fraucisco is closed agaiust them, and so, much to their injury, work is saspended. Now, in such times of need, the centre of the Stock-market, if there is one, is precisely the place to go, being formed for that purpose, at least one would think so, but they may as well go to Jericho as there, for the market is not open to them. You may sell auy other property when, how, or to whom you please, but your mining stocks you must get permission to sell. Such is the condition of many mines here, as you find by my reports-"work is suspended." Now, I cannot see that a change of system, by which means could be obtained to prosecute work, by a ready sale or hypothecation of reliable stock, neecessarily opens the door to wild-cat stock. The "cooking" system is not practised here becanse simply the mines are good. All $I$ contend for is that if a claim has a. local ralue of ten dollars a foot, it ought for the same reason. and from the same cause, because it is worth ten dollars, to have the same value in San Francisco.. For instance, the other night, a hall-share in the Massachusetts sold here for $\$ 1120$. How much for the same could they get in San Francisco? Not a dollar, good as it is. I hope Sanborn, Berry, and other leading men will think this matter orer. They may rest assured a change in this respect would be of immense benefit to the mining interest in the country, briag 2 safe and profitable business to the Bay, and put money in their own pockets. I think the brokers as regards this matter really are pursuing a suicidal policy. They have a worldwide reputation for geuerəsity-ever free, open-handed, just. Were they a sordid, sharp, crafty, money-loving class, I should appeal to their cupidity. Those who sit on the miners' throne, should give some little heed to the miners' rights and wants.
The last mine I mentioned in continuing my report was the Colmor, some ten miles east of north from Copperopolis, near Altarille. We must now come back to Salt Spring Valley, and begin with the

Thís claim contains 3,500 feet, divided into thirty shares. Main shaft eighty-five feet, with two drifts. The first drift, eighteen feet down the shaft, I did not see, but I am told it held good copper. A small vein was eat below, also, 75 feet deep, more west than they are now drifting, and to cat it again in a more easterly course is the object of the present work. This claim has hảd a good local value. The shaft, is sunk in serpentine rock, which in my opinion is not favorable. The Union lode, however, must run through the Ken-
tucky, so if they do not find it in this shaft they can in. another. I was in hopes of getting some handsome specimens of asbestos here, but those left were poor. I send you two, one of each kind. The peculiarity of this rock consists in its being impervious to fire. and capable of being woven into cloth. It has long heen nsed by the London Firemen, in cases of extreme need; and is, I suspect the great secret of the Fire-king of Frisco. I suppose the people have wearied of seeing him lyy this time and worship some other "curious thing," so I shall not injure his business by disclosing his secret. Contivuing on some three miles we reach the comet.
This claims contains 3,750 feet, divided into 25 shares. Main shaft fifty feet, showing a well defined lead two feet thick, with walls about eight feet apart. Work suspended to put up machinery. The Comet is certuinly on the Union lode, and will soon have a high value. A short distance from, parellel with the Comet is the

## framitin.

It contains 4,500 feet, divided into thirty shares. Main shaft, 20 feet; nothing going on here at present. Indieations good. Near the Franklin and parallel with it, is the

It also contains 4,500 feet, divided into thirty shares. Shaft, thirty-seren feet, showing a small vein well dereloped. Work suspeuded until next Spring. Aboat one-quarter of a mile east of these clairs, at the foot of the hills, and parellel with them is the

## buffalo.

This claim tas also 4,500 feet, dirided into thirty shares. Main slaft, sisty feet. with one drift tweuty-five. Rock much torn and bolted by a slide. A small vein found. These claims shorr very plaiuly the four reins of the Copperopolis system. Nest, up the valley three miles more, is the
With 4,200 feet, incorporated. Main shaft, thirty-five feet. This claim excited great expectations at one time; but the rock now looks so contrary that I do not like to venture a prediction. There is much work to he done heie. Nevertheless, indications of a vein exist. A mile further on comes the

## caledonia.

This claim contains 3,000 feet, divided into 3,000 slares. Main shaft, 105 leet. The Caledonia will shortly be one of the principal mines of the ralley. The rein opens well at the top, and goes down regularly increasing to the bottom where it is twenty-two feet thick. The veins at the present consists entirely of mundie, and may change any day to copper. A clange in the rock is very perceptible now. If they do not have a hig thing here, I know not where they will find it. As excellent engine from Coffey \& Risdon of the Bay, has just been put up, making the works very complete. Mr. Brown and Capt. Frost showed me every attentiou. Proceeding still some miles, to the north of Stockton and San Andreas road I finish the mines on the Copperopolis lodes, and leaving the Salt SI ring Valley, come into the Spring Valley District. First here, is the

## Jefferson.

It contains 2,800 feet, aivided into fourteen shares. No work going on at present, the owner paying so much to the Forty-inine, as one shaft will develop both claims. : A very good and prudent arraugement.

## taf fortr-xine.

It contains 3,000 feet, divided into 3,000 shares. Main shaft, fifty feet. This mine is eventually going to stand high. When down 100 feet, the rock will lose what little corruption it bears at present, and show a strong vein. It contains good yellow sulphurets now. On the east of these claims a few yards is the

## u.iberty.

It contains 2,800 feet, divided into fourteen shares, with two shafts, fifty and forty feet respectively. In the former, the indications are good; the rock carrying strong sulphurets. In the latter the reiu dipped out with such an inclination that a third shaft will be required: Again, west of these, betiween three and four hundred feet, but parellel with it, is the

## pocatontas.

It contains 2,800 feet, divided into fourteen shares. Main shaft, fifty feet; which has been put down principally by one man working alone, Mr. Gaffneff, formerly a liquor dealer in

It is the most striking and creditable instance of individual pluck that I know of. Thought at one time that it was all lost labor, but a closer examination shows me I was wrong, and that the old geatleman has a righlit good chance. Ho drills and blasts alone, timbers alone, hoists alone. If he does not deserve a good reward, who does?
I staid all night at thê Briant House, kept by a gentleman of that name, and which is certainly one of the best road-side hotels I know of in California. The next moming Mr. McKeon accompanied me round. He is largely interested in copper, and lias made himself well acquainted with the Copperopolis veins. We visited first the

## constitution.

This claim contains 2,800 feet, divided into forr'een shares. Work just commenced with excellent croppings and openings. It is two miles east of the line of the Union, and appears to a swer to the course of the Crockett. Something orer 100 yards east from this is the

> spring valley co.

This claim has 5,000 feet, divided into 250 shares. Main shailt fifty feet, with vein well developed. One hundred feet ought certainly to give good copper. Next is the

## bueva vispa.

I find I omitted the dimensions of this claim, It is a contiouation of the Constitation though two 口uiles from it. The indications and croppings here are really magnificent. The Buena Vista is lucated on a very high hill on the south side of the Caldveraz, giving a glorious view of the whole country. Recrossing the river, and going west. of north some two miles we found the

## sam boorer.

This clain is named after Gen. Booker of Stockton. It contains 2,800 feet, divided into fourteen shares. Main shaft 107 feet deep. The vein opens well, I understand, at the bottom. The rock carries abundance of mundic, and looks well. Work suspended natil next Spring. Mg own opinion is this will be a good claim. From here we rode quita a distance to Mr. Pattee's hotel, where we were very politely received, and proceed to the

## jackson.

This claim contains 4,600 feet in 200 shares, Main shaft forty feet deep. The vein well developed at the bottom. The rock is pure, carrying mundic and yellow sulphurets. Depth only is required here to have an excellent mine.' I have to apologize for not visiting the "Sylvester," another claim near the Jackson, as I promised to do so the uext morning. I beg to state I could not find it. I proceeded then to Mr. Coles of the North American Honse, another excellent hotel, eight miles lower on the Stockton road, where I met friend Weihe of Stockton who was up on $a$ shooting trip. I was happy to lear from him that the Stocktonians are well pleased with our efforts. After dinner we all drove out together to see the

## young america.

This claim contains 6,600 feet in thirty-three shares. Main shalt 140 feet, showing a good opening, and a strong vein all the way down. The work is well done, though the shaft is a little too stnall. The rock at the bottom in spots is peculiar, being soft as if slacked by lime. It carries an immense body of mundic, with large thick veins of yellow sulphurets throngh it: I told Mr. Cole they might strike the vein at any hour, and at Jenny Lind two days after I understood they had done so, and to use a common mining expression "struck it grod." If they have not they soon will. This claim is on the Gopher system, and before long will stand high.
Here closes the Sult Spring Valley and Spring Valley mines. 'Caken altogether they look very well. I have now only the Jenny Lind and a few others on the road back to Copperopolis to report upon, which I will " write up" without delay.
L. H .

Geological Survisy of Great Britian.-The Geological Surrey made considerable progress duriag the last year; two thousand four hundred and thir'y square miles were surveyed in Cieat Britiau; the publication of the maps proceeded, and mempirs were issued fllustrating the geology of the Isle of Wight and the country aruund Bolton-le-Mours. In Ireland the nery ground examined amounted to about nne thousand and twenty-eight square miles; four new umbers explanatory of the maps were issued. The survejors were also engaged on the re-examination of the districts of igneous rocks rumning from Wicklow into Waterford-London Mining and Smelt-
ing Magazine for October.

Tue Aurata.-If the New Turk Buard a Chderwriturs are wise thry will chose with the prupusition of respunsible parties in this city, whu have offered to undertake the tais. ing of the A quite tor $\$ 1$ ind, non in golld. This party offers to asve the Aquilu, if it is practicable, and to guarantee the safe raising of the Comanche under any circumstances. If necessary, they bind themselves to buik a coffer dam entirely arsund the wreck, and pump it out within a given time. The answer of the Underwriters is not yet received.
That the cargo of the Aquila cau be saved beyond a peradventure. is a matter that can searcely admit of a duabt. The ship lies directly alongside of a substantial wharf, with her stern some ten feet out of water, and her bow thirty feet under water. It is a matter of tho utrunst ascouishment that a party of wreckers, with suitable diving apparatus, has not long since been set to work to take out the carge of this ship, by taking off her deeks and raising the cargo piece by piece. If danger from etorms is appreheuded, there are varions ways that she may be rendered perfectly secure in her present situation.

The trouble seems to be that nobody appears to own her-she being held by these parties in interest-the Government, the Underwriters and the Contractors - each disclaiming any positive contruling ownership, and each asserting that she is in the hands of the other. The contractors have evidently made a loosing speculation, and have apparently nothing to gain by moring any further in the matter. The Government has adraneed $\$ 340,000$ on the Comanche, which amount is fully covered by insurance, and therefore bas nothing to loose pecuniarily, as the matter now stands. The amount of insurance affected by the contractors, does not appear, but at all events the underwriters do not seem disposed to accept an abandonment. Thus it appears that the city of San Francisco with all her valuable commercial interests, are to be kept in jeopardy for an indefinite time, while these several parties are endeaviring to settle their dispute with regard to title. It is earnestly to be hoped that the Government, if neither of the other parties can agree in the matter, will step in, and in some manner close a contract with the San Francisco company above alluded to, so that this much needed security to our harbor and coast may be raised, set up and made ready for duty at the earliest possible moment, This work cannot now be done mach inside of a year at best. Had this unfortunate accident not occurred, from five to six months only would have been required to have put the Comanche afloat.

## REESE RTVER CORRESPONDENCE.

## Austix, December, 1863.

Editor Mining Press:-Since writing my last commui eation, I have stood a "Looker on' in Veuice," waiting for events to settle down into some tangible shape, whereby I might give your readers the true status of things, as received on the ground. The condition of the mills here is not entirely satisfactory, as but one in the cañon, has been in operation during the past week, the rest are being housed or inclosed as fast as possible. I may make an exception in the case of one, which seems laid by entirely for the winter with only a temporary shed over the boilers and machinery. amador district.
The chief attraction, the centre of all, as I may say, is turned to the Amador District, at the foot of the Eastern range of hills, skirting the valley of the Reese River, several miles north of Clifton. This is not a distinct district, but called so to designate its locality. About six weeks ago, the Amador ledge was discovered und as the work ou it progressed, revelations of great promise were developed until the whole population became wild with excitement, and now, I doubt if there is a miner or an individual who could get arvay, who has not been over there with his pick and shovel prospecting. A town has already been laid out, called Coral City; and buildings are being put up as fast as lumber can be had.

In the canon, this side, I was told to day, machinery for a five-stamp mill, had arrived on the ground, and would be in operation as soun as it would be possible to putit up. While there is plenty of water, it is to be regretted that there is a deficiency of wood in and around that locality. The nearest considerable woudland, is eight miles up the same range of hills, or in sight across the valley of the Reese river, twelve or thirteen miles distant, in what is called Ravenswood district.

## the anfador mine

Is located on a gentle incline, facing the West. The ledge has been opened twelve feet below the surface, exposing a finer quality of quartz than in other districts, full six feet wide, tinted țhroughout with the blue sulphate of copper, and holding somewhat plainly, bi-sulphuret of iron, with some show of horn silver and bromides. I bave yet to see the first man to speak unfarorably of it. This, together with my own information, induces me to pronounce it a first class mine.
other mines.
Every claim taken up, in that district from which I have seen specimens, seems to be of the same classification of rock peculiar to this district. The Gen. Banks, another mine located on the same incline, two hundred feet below the Amador, running parallel and directly in front, is highly spoken of, and is said to be equil, if not superior to the Amador both in quantity and magnitude. From personal observation, I cannot speak of its vastness, as it was not stripped when I was on the ground, though I can pronounce it to all appearance nearly the same in richness.

Other mines have been taken up; indeed, the whole mountain has been run over, and wherever any indications were exhibited they were taken up at once, and, from appearances, with promise of a rich-reward.

Unfortunately for mines outside of the charmed circle, they do not seem to provoke any inquiry, probably not that they are worth less, but the new mines, more.

## desperadoes about.

We are having a rehearsal of the times of your city before the days of the vigilance commitee, wherein life has no secnrity or protection, and it is seriously contemplated to adopt the same course of proceedure, to rid ourselves of a class 0 : murderers who regard human life as a plaything for their bravadoism and courageous (?) exploits. It was but a day or two since that two men were shot dead and the third mortally stabbed.

## confidence in the mines generalit.

With all the drawbacks we have with the mills, I do not see that the confidence in the bidden wealth of this section, is the least abated. With the best mines, I do not see any lack of progress in their development. This surely indicates no discouragement and should prove the full faith in the integrity of the mines, by capitalists and others, most interested in their development, and ultinate success. It is probably
true, that many claims have been taken up and forced upon the market by sharpers, whose specitic object was to fill their pockets, and then let the burthen fall upon their dupes; also that many with honest intentions, have embarked in the same enterprise and found they had mines not worth the powder to blow them up.

## heedless investments.

I have often wondered how a business man, who would not purchase a peck of beans without first examining them, or pass over money without balancing the equivalent well and long; is so ready to accept any man's " ipse dixit" when it applies to mines, and । ay over thousands at the sight of rock studded with metalic globules, containing but a small percentage of silver. Take any other species of property, and the voucher of a saint will not answer his purpose. He must see for himself, and study the probabilities of a retnon from his investmeat. Let him apply this attention in his choice of mines and he will have less regrets to burden his soul, and mbre money in his coffers. If a man wishes to invest iu mining speculation, and his attention is called to any particular locality, he bas ample means to know what he propose to purchase, even though he cannot risit the mine bimself. Thro agencies established in almost every district, a pretty fair conclusion can be formed, corroboratory, at least, as it should be, of the representations upon, which he originally proposed to purchase.

## SACRAMENTO.

The persistent and indomitable energy characteristic of Californians is strikingly illustrated by the recent accomplishments of our Sacramento neighbors. Doubtful if there is upon record the example of any community that have been so repeatedly impoverished by misfortune who have so promptly rebounded and risen to prosperity. Eighteen months ago one could see no encouragement or but little hope.for the city to sustain her greatness, but now her darkest daya seem passed, and with newly graded, gravelled and planked streets, mammoth levee, State Capitol and Paeific Railroad, she appears again upon the broad track of prosperity. The foundries, machine shops, and variuus manufactories have been evjoying an unusually flourishing season.

## the legislature

Organized in both branches promptly and harmoniously on Monday, the first day of the session. Tuesday the Senate met the Assembly in joint convention and canvassed the vote of the State Election. The vote for Governor sums up 108,905, Mr. F. F. Low receiving 64,283 and J. G. Downey 44,622. Mr. Machin, for Lieut. Governor, received a majority of 20,950 over Mc Kinstry.
The Inauguration of Governor and Lientenant Governor took place at noon, on Thursday, in the Assembly Chamber, after which Mr. Low delivered a very sensible address, in a plain, pleasing manner. A substantial military display was one of the features of the day, and a splendid ball was held at Agricultural Hall in the evening.

## sober inteliagence.

In appearance our State officials show an improvement in favor of sobriety and intelligence, and cold water will doubtless prepouderate in Sacramento this winter, without the aid of floods. The Legislature bave exhibited an appreciation of aseful knowledge by giviug the Mining and Scientific Press a liberal subscription list in both Houses.

## tee Lobby.

The "Third House", of which (as a brief member) we must speak modestly, has sadly degenerated in numbers but highly increased in respectability.

## the legal tender issue.

The question of the repeal of the Sanderson contract bill of last session, is likely to become a prominent one, and from the sentiments we heard expressed by varions members, we think the chances are in favor of its nullification. The grounds assumed by those in favor of legal tender circulam tion is that thousands of dollars are now coined by importers and wholesale dealers through the premium on gold, and consequently consumers are-holding on to the short end if the stick; and further, that the bill is an ind rect discountenance of the Government's treasury notes as legal tenders, not particularly complimentary to the patriotic repa. tation of Californians. The matter will certainly be ably

Reses River Items.-The following paragraphs are from the Reveille of Dec. 3d:
Anoreer Mus,-The machinery for another quartz mill, to be run by water, owned by Hon. T. G. Plielps, has beea deposited on the site selected for it, at the luwer end of Lander City, on Big Creek. We like to see these evidences of the faith of mill men in the richness and permanency of our mines.
Tiefnan \& Co's mill, Lander City, will be ready to run shortly. The batteries bave not arrived as yet, on account of sonse delay on the road, but a large arrasta has been built, and the pans put in order, which will be used for crushing and amalgaraating until the batteries can be placed upon the ground. A large quautity of Great Easteru ruck is at the mill, ready for crushing.
Tre Amador.- Near fifty men are daily employed on this edge, stripping it, rumning a tunnel, etc. If this energy is continued during $t$ e winter, the Amador will, by spring, be in a very advanced stage of develupment, and un immense amount of rock will be ready for crushing. We are pleased to see such enterprise. If all our mines could or would exhibit such, it would require only a few mouths to develop to the satisfaction of all, the vast riches of this region.

From Hexboldt.--Cbarleg Barber, from Sierra District, has shown us a very pretty silver brick taken from ten lbs. of rock from the Eclipse Series. He gives encouraging accounts of the progress of mining development in Huabboldt. He feels fully confident that that region will be shipping large quautilies of bullion inside of two years.
Owev's River.-A gentleman writing from Owen's River o the Aurora Times, says: "that country will no doubt prove to be as rich in gold and silver as any yet discovered. The Slate, Russ, White -Mountain, lnyo, Coso, and Slab. Range, are all rich as far as prospected. The San Carlos Company are pushing their work ahead, and will soon have their mill ready to commence crushing rock. Bend City is getting to be quite a large place ; also, San Carlos. There are families coming in every day, and settling up the vacant land. There is plenty of as good land here as I ever saw in any cuuntry, and I think this will, in a year or two be one of the finest places on the Pacific Coast."

## MINING SHARE MAREET.

The Mining Share Market, for the past week, has been characterized with extreme dulness, and quotations, as a general thing, have fallen off. Chollar, Sierra Nevada, Daney, Grass Valley and Wide West have each met with slight improvement; ; while the Ophir, Gould \& Curry, Buraing Mascow, North America, Lady Bryan, El Dorado, Chihuahua and Western Summit, Utah, Sheba, Melones, Justice and several other minor stocks have fallen off from last yuotations. An unusual amount of assesstnen's, recently levied upon several promineut mines, has contributed in part to this depreciation. The ardor of speculators has become very much dampened of late, while outside buyers are much more wary than formerly and much less inclined to invest at any price.

Gould \& Carry has been more in favor during the past week, with very little offering. Uffers of $\$ 4,450$ have been freely made, without finding sellers, alchough we notice a single transaction at that figure. This is $\$ 50$ less than last week's figures. Dividends for the month have been freely sold at \$140. Remittances of bullion from this mine for the week, have exceeded any previous similar period.
Ophir shares have been dealt in to a less extent than for several weeks previous, and at prices generally about $\$ 25$ less than last quotations. Notwithstanding the increased dividend, ( $\$ 60$ per foot) declared last Monday, dividends for the current month have been sold at from $\$ 40$ @ $\$ 4 \overline{5}$.

Uncle Sam is considerably sought after at about last quotations. It has changed hands during the week at froin \$430 (a) \$440. But few transactions are reported, holders being generally firm. Accounts from this mine are bighly encouraging. The company has a large amount of very fine ore already out, and are constantly raising more. They have an 80-horse engine just arrived upon their grounds and are busily engaged in putting up a substantial engine house.

Potosi is quiet, owing probably to the announcement of an assessment of $\$ 50$ per foot. It is said that the present indebtedness of the Company is small but that further oatlays will be soon required in the thorough development of the Company's mine.

Savage is well maintained, and favorably regarded by per-
manent holders ；Eales wero made a few days since at $\$ 2 \% 50$ dividend off．
Hale and Norcross is much firmer，and has changed hands at $\$ 1,100$ ．The new vein fuund in this mine is said to be well concentrated and improving in appearance．
Chollar has been largely dealt in，at prices ranging from 868．）to 675．The recent assessment of $\$ 50$ per fuot has not effected the atuck unfavorably．
Baltimore A merican，which opened the week at $\$ 32$ ，de－ clined to $\$ 24$ before its close．
Lauly Bryan is iu demand at 910 ．We hear nothing fur－ ther of th：late repurted＂strike＂in this mine．＇Three hun－ dred and forty－five shares have changed hands tho past w eek， sgainst more than double that number，the week previous．
Wide West has been steady at $\$ 65$ ．We notice sales， however，at \＄7．

Real de！Monte has declined to $\$ 350$ ；Utah to 40 ；Bam－ boo $\$ 28$ ；Crocket；Chihuahua and Westera Summit \＄18． Antelope is quoted at $\$ 120$ ；Esmeralda at $\$ 13$ ；Silver Hill at $\$ 13 \frac{1}{2}$ ；Garabaldi at $\$ 8$ ；Bamboo $\$ 6$ ．
Mins Prietu is quated at $\$ 240$ ，with $\$ 250$ asked ；San Nicholas \＄7̄ and La l＇rovidencia \＄y．
Burning Muscow still continues the excitement of the Board，and has been largely dealt in during the week．Oue thousand and sixty shares（one eighth of the mine）have changed hands at prices fluctuating from $\$ 130 @ \$ 150$ ． An assessment of $\$ 10$ per foot was levied on Saturoay．The i djunction suit of the Ophir Company vs．this Company，had been modified，allowing the Moscow Company to prospect and timber their mine，but not to remove the ores．

Real Del Monte changed hands at $\$ 100$ ，but is not now quite so well sustained．We learn nothing new touching the progress of the coutest now pending between this and the Pond Company．
Sheba has been considerably dealt in at from $\$ 1521 / 2$＠ $\$ 15$ ．
Melones rose from $\$ 95$ to $\$ 110$ ，buyers 30 ，but has since materially declined．

Baltic has fluctuated between $\$ 80$ and $\$ 90$ ，and closing sales were made at $\$ 85$.

North America has improved within the past few days Thie claim is in better repute，and is likely，under judicious mavagenent，to assume a better position in the market．

Amador（ $\mathrm{K} . \mathbf{R}$ ）is creating no little excitement．Receut advices state that from $4,400 \mathrm{lb} 3$ of average 20 ck from this mine， 200 tbs of unretorted amalgam were obtainet．The company have，it is said， 100 tons of ore reajy for crushing， and are vigorously at work opening their ledge in a number of places．$\$ 250$ is bid for the stock，$\$ 1000$ asked．See letter of our correspondent，in another column．

Coral，an adjoining claim，is said to be in much favor at enhanced rates．

Owens River，private sales reported at $\$ 30$ ，and at $\$ 75$ 50 feet at the latter figure－little offering．
Santa Rita，an extension of the above ledge，sales re－ ported at $\$ 30$ ．The market for both the last named stocks is inactive，but they are regarded as promising and valuable．

Willow Consolidated（Summit District，Reese River，）is held at $\$ 20$ ．The Company are in treaty for a mill to be placed on the ground ready for active operations early in the spring．There is some enquiry for the stock，but no sales reported．

Tur Mines of Mexico. - The Eeho du Paciffyne, in an article ou the mines of Meaico,
"It is neeessary to give the Americans their due. No nation in the world has such an chterfyixing athe adrenturous apinit. Whea whe lerk it the fresient develophtant of the Mexican mines, aud when we consider the last, we are astunifined at the listlessuess of One people aml the nadacity of the uther. Fome of these mines which for generations lave remained in ublivion, or have been buried under the mass of ruins which had gathered in them, or have been filted with water, are now re-upened and worked at a profit. The indifference of the Mexican yesterday makes the wealth of the American tu-day.
The ambition of the American, lis pride, and his sovereign contempt of everything but himself, may aliemate the affectiou of other nations, but it is not the les true that wherever he goos fortune accompanies him, life expands and ubundance reigus. Certuinly his manners and laws do not please everyboly; but it must be admitted that nature has gifted hin with exceptional qualites, and that ho is indead the man for our new countries. In his hands the mines of Hexico will exhibit a weulth not yet suspected by the world.
Rotnscumbd has taken four million pounds sterling of French treasury bunds at five per ceat. interest-the whole loan is $\$ 60,000,000$.

Colt's Armory in Fartford made a gun a minute, for ten hours a duy, during the month of October.

Pathat Clanss. - We will furuist, on application, the cluid of auy iavention that has bempatented withiu the if partent years. The nume of the patentee-date should be cont.

Mowbis-Inventors will plense attach to all models sent to ur, their names and address, tu a legible, per manent furm, this will avoid confusion and prevent errors.
Drumings.-We have highly talented and eflecient Braughtsmen, by whim drawiags of every discriptions are executed in the best stgle of art, with promptitude sud at a moderate cost.

## taxing the mines.

The Secretiry of the Iuterior, in his report, a synnpsis of whicl has been received hy telegraph, still persists in his favorite theory of taxing the mines. The Secretary states that at the time of the discovery of the great mineral wealth of portious of the pululic douain, the nation was in the eujogment of domestic tranquility and unrivaled prosperity and could well afford to throw opea her rich mines of precions metals to the unrestricted enterprise of the world ; but having now been forced into war for the preservation of our national existence, as unexampled iu expense as in magnitude, the question as to whether we can, in justice to other branches of industry and enterprise, longer exenpt this immense source of iudividual revenue from its equitable share of public burde becomes of much importance. A small proportion of the profits on gold miues would largely increase the meanis of the treasury, and as no good reason seems to exist why the nation should not, in its hour of need derive some direct assistance from its extensive fields of gold and silver mines, he earnestly presses the consideration of the subject with a view to that end.

By the provisions of the income tax the mines of the Pa cific Coast are already taxed in proportion to all other industrial pursaits, and we do not know that auy serious objection has ever been urged against suclı a poliry. There is tuo disposition on the part of the miners of California to seek exemption from their just proportion of the burdens which the present uuhappy war proposes. No especial tax could well be imposed upon the mines except in the way of licenses. and such an impos tion would most nssuredly result in producing a falling off in the gield of the precions metals, which would work a far greater damage to the general interests of the governament than could possibly be remedied by the direct income it would receive from such a source.

The benefit which the General Government is even now reaping from the mines of the Pacific Slope is by no means confined to the three and five per cent, income tax already imposed. The credit of the Government could never have been maintained at anything like its past and present slatus bad it not been for the millions of treasure which are go ng formard every month from her mines on this Coast. Without this constant supply of gold, government paper would not today have been worth more than one half its present price It cari scarcely be considered extravagant to assert that the mines of California are actually beuefiting the government pecuniarily each month, quite as much as an income equal to the entire yield of the mine for that period would do, if drawn from the ordinary sources of government sapport. It is only by keeping these mines open aud free to all that this gield can be kept up to its present standard. Impose such a tax upon the mines, as is indicated by the Report of the Secretary of the Interior, and the falling off in our monthly yield of the precious metals will affect government securities to an extent many times greater that the entire tax which can possibly be collected. Let the goverament beware least, by tamperiug, it kills the goose which lays the golden egg:

Avotiner Ritil Instuvery-Pbriaps.-"Cosmos." writing to the Bulletin, from Vivginia (ity, under date of Dec. 12th, says that "rumbors are afloat respecting a new strikeanother: Comstock. The ore is of the same character, and assays $\$ 6,000$ per ton. I will say nu mure on the suthect till I find out more ahout it ; and hesides, you Sau Franciseans appear to have about concluded that you don't care much about having anything more to do with "feet," auyhow. Sereral new developments are being brought out in the range below Guld Hill. The one in the Uncle Sain and Mary Ann gives great encouragement to those hulding interests in the line, thongh distant."
Mineral. Wratifu of Utam. - The Guvernor of Utah, in his Message just communieated to the Legislature, speaks glowingly of the mineral wealth of that region, and recommends the immediate adoption of the general laws of Califorwia on the subject of mines, the incorporation act of that State haring stood the test of time and experience. It pays a just tribute to the efficiency, energy and valor of the California Volunteers, and recommends the erection of foundries for the manufacture of iron, from native ore, for the Pacific Kailroad. The finances of the Territory are in a good condition. There is now in the Treasury a balauce of \$26,799.
New Invention in Picture Coloring. - Herman M. Bien, of this city, according to the Alte, has applied for a patent on a. newly discorered process of coloring common photugraphs with oil colors, in exact imitation of nature, which he denominates Photoleneography. The pictures treated by this process have a sharpness and clearness of outline not attainable by the water color process, and, it is claimed, will retain the color unfaded for any given length of time. For copying specinuens in botany, etc., this process would seem to be of great value. The inventor clains that he can color one hundred likenesses by this process in a single day, and bave each one a perfect picture.
Opposttion Straner Day.-The Pacific M. S. Co's Steamship St. Louis, and the Opposition steamer Moses Taylor, Ieare for Panama on Wednesday, December 23 d.

## A Reese River Mill.-The Reveille has the following,

 in regard to a week's crushing at the Fountain mill, in Jacobsville : Some Yankee Blade ore yielded $\$ 425$ to the ton, the bullion from which can be seen at Hayne's saloon in Austin. Amador ore yielded still more, but we did not obtain thee exact figures. The Emma Funstun, the rich rock being taken from which we alluded to in a roceatissue, worked up to the enormous sum of $\$ 2,700$ per ton. During the week this mill has worked ore from the Nonesuch, Marengo, Samantoa, Duukirk and Silver Eagle, but complete returns lave not yet been made. It may be $s$ ated, however, with a certainty, that the yield of none will fall below $\$ 200$ per ton, aud in some will be nearer $\$ 2,000$.Pigs of load, with the bame of the Emperor Fadrian upon them, are suid to have been found in the Island of Sardinia, where the Romans, as is well known, had important metallurgic establishments. The Marseilles house, Bouquet, which owns extensire mines in the island, has made a preseut of these pigs to the miuseuna at Cagliari.

## [From our Traveling Currespondent.] JENNX LIND.

Mr. Editor:-In my last report I stated I had at last got through both the valleys, and had only to take from this place back to Copperopolia. The mines I shall speak about after finishing those in Jenny Lind, lie west of Copperopolis, a portion of them belonging, to the Gopher system, and the bal ance distinct by themselves running down the walley to White's Ranch, where the Stockton road intersects it, bet ter known to the public as the "Four Springs."

Jenny Lind is a small Mining town on the banks of the Calaveras River, where a short time ago there were some very rich placer diggings. It is somewhere about thirty miles from Stockton: Considerable money circulates at times there, I am told; and it is destined, I believe, to see a brighter day than ever, when its copper interests are more matured asd developed; for it cannot be devied that so far as external indications go, the leads show themselves here boldly and strongly; while the result of the work upon them which so far has been done, are by no means unfavorable. In locating the leads at Campo Seco, Ilaid down a course for the Gopher systera, which would bring it through Jeney Lind, and I find strong evidences in every direction of the correctness of that location. These I shall briefly mention as I come to them.

A gentleman by the name of Macclebee was kind enough to accompany me the first day. Crossing the river at the town, and after proceeding some miles to Rich Gulch we found the
dehlonoga.
It contains 2,250 feet divided into seven shares. The croppings and opening here are very good. The rock carries mundic largely, and looks well generally. Work to recommence immediately. Next to this, quite ncar is the

## Water privilege.

It contains 3,600 feet, divided into 3,600 shares. Here they are running a tunnel from Rich Gulch, and from the excellent appearance of the rock cannot, I judge, have much farther to go. There is also an immense body of mundic here. This claim looks, well. Not far from here is the

## re dorado.

It contains 5,400 feet, divided into 5,400 shares. Main shaft forty-six feet deep; at present full of water. I do not like the location of this shaft, not being suitable for future work. The rock looks well, and shows a strong vein. From this claim something over a mile south is the

## маммоті.

It contains 4,500 feet, divided into 4,500 shares. Main shaft sixty feet-deep. This claim is looked upon as the claim of the place, and certainly the croppings and opening are splendid. The rock also is very pure, strongly impregnated with yellow sulphurets. They have, hqwever, sunk down too far west, the lead having already dipped out of the shaft. They are still sinking with an intention to drift east. I cannot see that policy. The labor they have done since the veiu dipped, and the labor they must do before striking it again, would have put a new shaft down on the lead all the way. This will however be a good claim. About onehalf a mile east from here is the

WALLOP.
It contains 4,500 feet, divided into 4,500 shares. Main shaft 98 feet. Work being suspended I could not go down, for water. The croppings and opening are excellent; rock pure, carrying much mundic. Altogether it looks well. Next, still going east of south a mile or more is the tectonia.
It contains 7,500 feet, divided into 7,500 shares. Main sbaft seventy feet deep, showing a well developed vein and foot wall. Everything here indicates future success. I have formed a very good opinion of this mine. It closely resembles the Collier of Gopher. Out-buildings good. We turn right about here for a short distance, and then come to the lafferrty.
It contains 3,600 feet, divided into 3,600 shares. Main shal't eixty feet deep; croppings and opening good. Rock pure. Work suspended, to be recommenced the following week. Still continuing back towards the Bushville or Rich Gulch for some distance, we reached the

## acacta.

It contains 2,700 feet, divided into 2,700 shares. Main shaft 46 feet deep, carrying a strong vein from one and one-
half to three feet thick. It is by no means pure yet, but only
wants depth. Close to this, also under the direction of Mr. Gage, is the - wyandank.
It contains 3,200 feet, divided into 3,200 shares. Main shaft 88 feet; with walls eight feet apart. It opens well with gossan, and shows streaks of mundic, lower down, one foot thick; strongly impregnated with yellow sulphurets. This claim looks well to be a winner.
On the following morning Mr. Brush, an old settler, in Whose honor the village was named, piloted me round; and like myself, soon found this copper-mine-visiting among the hills is not quite so pleasant as making New Years calls, On a sultry day it starts the dewdrops. After a long walk, however, we succeeded in reaching the
PLTMOUTH ROCK.

This claim contains 1,200 feet, divided into four shares.
It is a second edition of the Hughes Hill claim, Gopher District, only they have put up a large building with an arrastra to crush the surface rock, clay, talc, gossan, etc. It averages twenty-five dollars to the ton in gold. With their facilities of crushing and getting the rock this ought to pay well. The mill is worked by water-power. In connection with this claim, on the north side of the hill is the
digeton rock.
It contains 4,800 feet, divided into sisteen shares. As I have said already this was in connection with the above, only the company here are working for copper. On the north side of the hill they have rum a tunnel 160 feet north; probably 60 feet more ta go before they cut the vein. Their level will be 180 feet below the surface. Everything indicates the vein to be as strong here as at the Hughes' claim, and I am greatly mistaken if in the end it is not a splendid mine. Near the south side of the hill, a few hundred yards off, is the

It contains 6,000 feet, divided into twenty shares. Main shaft 45 feet deep. Here the foot-wall is well developed, with indications of a thick strong vein, probably four feet thick. I consider this a promising claim. Reaching the river, and going out of town, north-east some two miles I found the
jenny lind.
It contains 5,500 feet, divided into 5,600 shares. Main shaft seventy feet deep. Like all the claims in this vicinity the croppings are very handsome. There is unquestionably a strong vein; bat whether they will strike it in the present shaft is problematical. This sinking on low ground, expecting thereby to strike copper quicker than elsewhere, is a fallacy which has injured the pockets of several companies in this section. Keep off of low spots and allow forslides, is a good maxim. The rock in the shaft is so rent and twisted, no man can tell which way it really dips. On the opposite side of the river, I think the water has opened the vein to veim. Were I interested here I should examine that closely and be guided by it. My opinion is unfavorable to success in the present shaft.

This completes the Jenny Lnd list. Upon the whole, the mines look well. They are not developed as much as others because they have had no help from capitalists, but the day is not far distant when it will find its way there. I cannot close this account without mentioning an act of heroism, or rashness, performed here by a lady, which beats Blondin. Across the river a little above the town, the water company have a suspenison flume cousiderably over 200 feet higt. Before the pipes were put down, some ladies and gentlemen were examining the works, when a banter was given to walk across. 'The platform at the most could not be more than one foot and one-half wide, yet nothing daunted, the lady started off, walking across and back again, without a quiver or a halt. What made the feat still more fearful was the fact of the platform having canted in the centre, so that on coming there, she was obliged to walk side-ways. The lady is now married and keeps the Jenny Lind House. If she can't " keep a hotel," where's the woman who can?
Leaving Jenny Lind, I take you to Black's Ranch. This is a continuation of Gopher, being only a mile from the New York claim. The only developed claim here is the morphy.
It contains 2100 feet in single shares. Main shaft 64 ft .,
howing a strong vein, nearly twenty feet wide. Rock somewhat corrupt. The walls are very singular; I think they will have to go deep, but they have strong evidences of cop-
per. Near here are quite a number of undereloped, but promising claims, worthy the attention of capitalists. I cannot do more than name them at present. They are the Mun roe, Jefferson, Emerald Isle, National Ledger, Virginia Pine Grove, Rabbit Hill, Elephant, Josephine, and a gold quartz ledge, Buena Vista. This little, out-of-the-way, ob
scure conner will make a noise some day. My obligations scure corner will make a noise some day. My obligations
are due to Mr. Black, who is very intelligent, gentlemanly and well posted in copper feet. From here to Mr. S. Oohen's store is about three miles, where I found the salt bpring valley co.
It contains 3150 feet, divided into twenty shares. Main shaft 70 feet, carrying a. good vein all the way down. This claim is very important, and excites much attention just now ; for, although started for copper, it is supposed to be silver. Of the latter rock, I do not profess to be a very com. petent judge ; but, if in so essentially a copper formation a this district is, it is possible for a silver lode to exist, thin must be one. At present, it certainly is not copper. Mr. Cohen intends to sead a large lot of this rock to Mr. Clouser of jour city. I hope he will give the Press the result About a mile from this is the

```
Harlex.
```

It contains 4500 feet in 30 shares. This claim once reach ed as high as $\$ 5,000$ a share, and it is now lower than it ought to be. All the former work in the old shafts down as deep as 100 feet, was in serpentine rock, and you may as well expect to find gold bearing quartz with horn blende a to find copper in serpentine. I know, very well, copper is found up to the base of this associate; but never in quan tity. My opinion is, the copper miner had better becl against a monte bank than serpentine rock, from the one he may get perchance a stray dollar ; from the other, noth ing. A caretul examination of the Harlem confirms thil opinion. I was glad to find the Harlem people had com menced a new shaft, altogether away from the serpentine where they have a good prospect. The present shaft open well, and looks promising and hopeful. I have to acknow ledge Mr. Westby's particular attention to me. Continu ing from the Harlem down the valley, a mile below White ${ }^{\circ}$ ranch, is the

## wan.

It contains 3750 feet in 25 shares. Main shaft 54 feet with a very handsome rock indeed. It is on the Harler, lead, and lies west of Copperopolis about two miles. I ought to have been incladed in my second letter, but at that time I did not know of its existance. T'e rein looks wiel carrying yellow sulphurets. It is by all odds too importin to be overlooked. Below this claim is another, called the MAMMOTH.
It contains 6000 feet in single foot shares. Main shal commencerd, ouly twelve feet deep. Croppings gtod. Roc taken out shows strongly of mineral, and some yellow 部 phurets. Mr. Ring is superintendent ; work suspended ti next spring.
I have still three claims to mention, two of which ought 1 have been noticed in my first letter, but I did not know if them then ; the other at that time had not been locate The first is the
intmitable.
It contains 3000 feet in single foot shares; with hn shafts, respectively 30 and 40 feet deep. This is one of th early locations, but only recently attended to, or thoug much of. It runs parallel with the Union, on the east In the first shaft they got good rock; in the second, bett Joining this claim, running out of town south, is the

## metropoidtan.

It contains 3000 feet in single foot shares. Main shaft feet deep, showing excellent rock with yellow sulphurets jo appearing. 'The importance of these two claims consib to a great extent, in the fact that they will solve the proble of the linear course of che Union lode, through and diately south of the town. If the Keystone people g good copper out of their side claim (east) which would a continuation of these claims running north, as out of t old discovery shaft, and it is known they do, these clair become necessarily of great value. A s I look at it, the Kit stone thus becomes the great claim of the district, and she two eventually of corresponding importance. So impress is your correspondent with this opinion, that in connex with Mr. Stoddard, be has located 2200 teet in continuati of the Metropolitan, on the south end. With the indicatio of that claim, so far as the work has gone, we have eve reason to be satisfied. Adjoining this latter claim is the index.
It contains 2200 feet in 15 shares; in course of incon ration and being opened.
I have now finished the copper claims of Calaveras couni as far as practicable. Some few, I know, hare been omitt which I was unable to visit on account of the weather, cireumstances I could not control. I can truly say I hif not inteutionally omitted a single one, laborious as the wh has beea. Whatever I have said of each claim, I hare si in a spirit of justice, unbiaved throughout by any m. Some little mistakes there may be, but upon the wholt believe, I may claim to have given a copious and correct count of the present condition, and future prospects of es mine.

THE AQUILA AND HER CARGO.
The San Francisco Chamher of Commerce beld a special meeting on F'riday last, to cunsider what st.ps, if any, could be taken by that body to further the ohject of saving the Commanche, so needful for the defence of this barbur. During the deliherations it was made to appear, to the apparent satisfaction of the Chamber, that if the materials of the Commancbe, could be landed from the wreck, properly and promptly ulthough some part: of her furniture, etc., would be destroyed aud other parts much tarnished, still the stip might be speedily re-constructed, and placed in a proper coudition for the service, for which she was originally designed. Mr. Ryan, one of the cuntracturs, who was present stated to the Chamber, that the contractors were ready to go on and complete their contract as soon as the material was placed upon the wharf. Mr. R. further stated that insurance to the amount of 8400,000 had been effected upon the Aquila and her cargo which had been transfered to the Government on account of advances made on the coutract.

From this statement it appears that the Government has not, in this instance, departed from its well known custom, of never insuring against losses. It merely holds the policy issued to another party as security for advances made. It further appears that the difference of opinion, among the underwriters, with regard to their liabilities in the matter had not been settle l, so far as known, up to the hour of the above meeting.

The Chamber having decided that it was proper and exped ent that they should take some action in the matter, the following resolution was adopted as a preliminary step:-
Resolved, That a Committee of Five be apponnted to confer with the Underwriters' Agents in this city, and with ather persons, if neccessary, and to procure a written statement of all the facts that have been developed concerning the situation and condition of the ship Aquila and cargo, as they now lay, and also to procure a written statement, as authoritative as possible, of the respective claims and liabilities of the parties interested in said ship and cargo, both of which written statements to be submitted to an adjourned meeting of this Chamber, to be held on Monday, the 21 st inst. at 2 o'clock, P. M.
It is to be hoped that some deffinite action will soon be agreed upon, by which the Commanche may be landed and put up as speedily as practicable. We presume that no well informed person entertains a doubt, that had this wreck been private property, in the hands of energetic men of means, and not complicated by an uncertainty of ownership, the materials of the Commanche would, ere this, bave been in an advance progress of landing. To think otherwise would be an unjust imputation on the skill of San Francisco Mechanics.
The Earthevake, on Saturday afternoon was the severest which has been experienced in this city for the past eight years. Two shocks were felt-the second of which was much the most severe.,. They were accompanied with the usual rumbling noise, which at our point of observation, in the rear of the third story of the Government House, was quite as distinct and loud as would have been that caused by a heavy lumber wagon driven apidily and violently oven the cobble pavement in the street.
Ir is said that California produces but little corn, the soil not being adapted to its culture. Most of what is raised is consumed while green, at the table.

## SILVER MOUNTAIN DISTRICT.

Silver mountain District is situated on the last range of ', the Sierra Nevadas, near the eastern boundary of Amador county, being abunt forty-fire miles from the Big Trees and sixty-fire from Virginia City, N. T. The Big Tree and Carson Valley Road Company are building their road to Silver Mountain District, which will be fiuished by the first of May next, having only two miles to complete at the Silver Mountain end of the rou e. This road leads from Stockton, tbrough Murply's Camp and Big Tree Grove to Silver Mountain, connecting them with the Carson Yalley Co's Ruad which is nearly completed from Markleyville. This will give uninterupted communication from Stockton to Virginia City by stage, tapping the Monitor, Alpive, Mogul Silver King and Webster Districts on the way. Fieight can be brought over this route from Stockton at from $233_{4}^{\prime}$ to 3 cents per fb for eight months in the year.

Is the principal town in these Districts, and is situated in a valley lying between two ranges of the Sierra Nerada with a beautiful river munning througld it, fornishing a supply of water, sufficient to run the largest mills. It would indeed appear, as if Nature had set apart this spot for all the conreniences and facilities of a large mining town: The population during the past summer was from six to eight bundred persons, but at the present time it is coasiderably reduced in consequence of the road not being finished before
set in. The town is about one mile in leagth by half a mile in breadth. The principal business streets are Main and Unior which are parallel with the river. There are more in contemplation so soon as a sufficient quantity of lamber can be prepared for building purposës. There are two saw mills in operation which will furnish a sufficient supply in the spring to meet all reasonable demands; at present they are producing lumber at the rate of from 12 to 14,000 . per diem. The current price of lumber will be from 30 to $\$ 40$ per 1,000 feet, according to quality. There is now being made an excellent quality of brick at from 12 to $\$ 14$ per M., and several brick buildings are under contract, and will be completed in the spring. An excellent quality of freestone is found in abundance in the immediate ricinity of the town, which is well adapted for building. There are two good hotels, and two more are to be erected during the coming spring. The price ot board is from 6 to $\$ 10$ per week, and good lodgings at from 50 to 7 i ets. per night. There are six large stores with extensive stocks of assorted goods, suitable for a mining region; one French restaurant one tin shop and hardware store, one brewery, two laundries, three blacksmiths' shops, three livery stables, and innumerable pioneers of civilization, called whiskey mills, making in all quite a respectablemining town.

## the mines.

With regard to the ledges, they are for the most part, large and well defined, and run in a northernly and southernly direction with extensive croppings and fine indications of mineral wealth; they are found in all directions from the town to a distance of four miles and further. On the West side of the town are many claims which were the earliest token up in the District. The first that may be noticed, is the Mountain claim which crops out largely, very high up on the mountrin; the croppiags being about 25 feet wide. The owners have run a tunnel over 300 feet and struck a ledge which slows good pay rock; assays have been made as high as \$184 to the ton. A company of capitalists are now in negociation with the owners, to huy the controling interest,
and if, they consumate the porchase ${ }_{j}$ it is their intention to put up a mill and work the claim vigorously the coming season. The Silver Creek Co. which adjoins the Mountain Co. North, have run a tunuel 100 feet, and expect to strike their ledge at about 50 feet more. The St. Charles Silver. Prize Co., Mammoth, Geo. W ashington, Frank, Big Tree, Chrystal, Baltimore and Uncle Sam are on this range, and have tunnels averaging from 50 to 100 feet. North of the above ledges, and on the eastern side of Silver Creek, is the Mary Frances Co. This Company has a tunnel some 50 feet and will strike their ledge in 50 feet more, with every prospect of oltaining good pay rock.

At the eastern side of the town, is the Scandinavian Cañon in which there are some rich claims, the first of which, after leaving the flat is the Alta Co., owned principally by San Francisco capitalists. They have run a tunnel 75 fee
and are close upun the ledge. Immediately adjoining is the candinaviou Co. with 160 feet of tumel. Abore these are the Guald \& Curry, J. C. Fremont, Pine 'Tree, Buckeye, Extemuado, I. X. L. and Lady Franklin, winh many others which have beem partially pruspected.
As the I. X. L. Co. have struck their ledge and had a ton of the rock worked ly different processes in San Francisco, it deserves a brief enlogy. The I. X. L. claim was taken up in the spring of 1862 , by $J \Pi$. Willians and others, the claim exteuding 1000 feet. They lad tunnelled in about 50 foet, when they struck the ledge $4, \frac{1}{2}$ feet in width. The yield from one ton of the rock, worked by different processes averaged $\$ 200$. One piece weighing 20 Tbs, wooked by the "Varney" process, gave $\$ 627$ in gold and silver to the ton. This Company intend to erect a mill in the spring to work their ores. Very little stock in this claim is in the market, being nearly all held by capitalists in San Francisco; the principal of a large Inglish Banking House owning a large interest. The I. X. L. No. 2, is the Is North Extension of 1500 feetin extent and bids fair to be as good as the original; when prospected. The segregated claim of Treat \& Dodge, 100 feet, is the 1st South Extension and the Omega Co's clain of 400 feet is the next adjoining South. This is one of the best lucations on the ledge and will be thoroughly opened in the spring. They are sinking a shalt alongside the ledge and at a depth of 50 feet will drive through it, with the expectation of fiading very rich ruck. More Acon

## A MONSTER BLAST.

The Von Schmidt Gas Company, who have been leveling off a location for their works, on the south purtion of the square between $2 d$ and $3 d$ streets, and Corrusend street and the Bay, concluded recently to put a monster blast into the hill, near 'l'urnsend. This was effected by tunueling about eighty feet iuto the hill, with a cruss-cut of about 40 feet at the innermust point, $i$, the shape of the letter $T$. In this cross. cut in clrarge of about $1 \frac{2}{2}$ tons of powder was placed, and fired off about 10 o'clock on Thursday last ; the result of which is described as follows in the Altu:

The explusion accomplised all that was expected of it in the way of shattering the cliff, so as to facilitate the work of bluff, but very nearly served the inhabitants thereabouts in the same manner. The bluff over the tunnel and chamber
the was completely shattered, and the rents in the rock ereu exteuded sofar is to open large cracks in the surlace of 'Iownsend street. The report following the explosion was lardly louder than that of an ordinary 12 -pounder, but the shock
was so severe, that a larre amuunt of danace was was so severe, that a large umunt of danage was done to
sone of the buildiags in the vicinity. The dwellings of Messrs. Rising, Rubert, Grant, and Captaia Arery, situated on the sonth side of '1'ownsend street, near third, were all more or less damaged by the crackiug of the plastering and throwing d.wn of the ceilings; and the residende of Mr. Diviue on the east side of lownsend street, some distance back from the street, was shaken so that the cooking stove in the kitchen, jumped some inches from the floor, if we may
credit the statement of an eye witness. Mr. John Grant's credit the statement of an eye witness, Mr. John Grant's
house was the most injured, the ceilings beng damaged to the extent of nearly, or quite, $\$ 1,000$, In the huase of Capt. A very, a small statue was thrown ont of a niche in the wall and broken to pieces by the force of the shock. Mr. Grant
had intended to have an injuaction served upon the com had intended to have an injunction served upon the com-
paby, to prevent the explosion coming off, but they got tue payy, to prevent the ex
start of him for once."

This, we believe is, with one exception, the heaviest blast ever fired in California. The exception to which we refer was one which took place near Smartsville, in Yuba connty, about a year ago. In this blast about twice the amount of powder was employed. A tunnel was ran into the hill 190
feet, with a cross-cut of 25 feet, in which the feet, with a cross-cut of 25 feet, in which the powder was placed and the tunnel tightly closed and packed or "tamped" with earth for the space of about 75 feet from the entrance When the explosion occurred, the hill for about 300 feet square, from the bed rock to the surface-a distance of about
100 feet-though 100 feet-though composed of very hard and compact cement, was thoroughly broken up, and thrown into ridges, yery much like mammoth plow furrows. The amount of earth
thus loosened would require a stream of 400 inches of water for over three months, for washing.

Fast Stramboating.-The Daniel Drew, a fast steamer on the Hudson, is said to have recently achieved 16 miles in in 36 minutes. This statement is almost incredible.

The present total revenue of Russia is $£ 44,374,248$, of which $£ 18,000,000$ is obtained from the tax on brandy. t£15,225,111 goes to the army, and $£ 2,241,404$ to the navy.

## THIE CH CAGO, or "NICHOLSON" PAVEMENT.

Mr. Edifor-I nutice in your issue of the 13th instant, the following paragraph in relation to the uew wooden pavew ment, recenily introduced into Chicago, and now generally known througbout the north-Western States as the "Nicholson Pavement:
Cuicago Wood Patemerts.-The Board of Works in the City of Chicago have given the preference to wood pavements over those of stone, as heing the most durable of any kiad yet used there. The following is a description of the nethod of construction: Lay down fooring of one inch board on a
bed of sund; coat the flocr with asphaltum: stand on end blocks of wood six inches high, by three inches thick, and nine inches in length, in rows abont one inch apart, divided by strips of boards. Fill in these open natrow spaces with asphaltum. There are six miles of these paveurents in Chricago, which after six years constant wear, are found to be nearly as perfect as when laid down.
As I have for some time been well acquainted with the facts in relation to the introduction and wear of this new pavement, I have thought it might be interesting to many of your readers to learn a few lacts in addition to those given in the above paragraph.
Chicago not only thus, but the city of Milwaukee, Wis., which has ever been noted for its smooth brick parements, and other cities have commenced laying the Nicholson Pavement. The expense of this paring is less than that of stone -is laid with great rapidity, and for durability, as well as level smonthness, has never heen equalled. Carriages move over it with all ease, and without the least jar; the blocks are seldom if ever, torn up, being tightly-wedged in with coal and pebbles, upon which hot tar is poured, and then covered with coarse sand or pebbles. The Nicholson pavement is superior to any other, and gains the awarded tribate of excellence of all who know of its superior merits and durability. Western cities have grown disgusted with brick and stone and all the old pavements are being torn up to make way for the new "street lloor," the Nicholson pavement. The city of Milwauke laid, during the last year, three miles of this pavement, and Chicago as much more, and both cities will ere long have no other. Cincinnati and Detroit have contemplated and are making arrangements for the same kind of pavement, through the principle business streets. Lisle Lester.

Treastre Saipment. - From the 1st of December to the present time the armount of treasuce shipped from San Francisco to the various ports aggregates $\$ 2,812,858$ 96. The oftal amount shipped since Jany. 1, is $\$ 44,111,999$ 13. The total amount for the correspouding period of last year was $\$ 40,830,18241$, showing an excess in the shipments of this year of $\$ 3,281,81672$ over those of last year.

## MINING SHARE MARKET.

There has been a fair amount of business in the mining share market, during the past week, and prices have generally had a favorable tendency. Encouraging reports from the mines have given new life and activity prevades the market. Ophir shares bave been in considerable demand at fluctuating prices. At the annual meeting held on the 16 th inst., the following gentlemen were chosen Directors for the ensuing year : E. Martin, Chas. F. Lott, Joseph Woodworth, A. E. Davis, J. B. Haogin, L, W. Coo and Jesse Holiday Mr. E. Martin was chosen President, and Mr. Lamib continued Secretary. Mr. W. Palmer, who has, had charge of the mine, as Superintendent for the past year, is continued in that position. Many had supposed that- the meeting. would have been somewhat atormy, but the reports of the President and Superintendent were so catisfactory, that it passed off very harmoniously. The latest accounts from the mine, particularly from the north end, are highly eatisfactory. Dividends for the present month have been sold during the past week at from $\$ 37 @ \$ 42$ per foot.
Gould \& Curry have advanced to $\$ 4,800$ cash, and $\$ 4,900$ at thirty days. Dividends for December sold early in the week for $\$ 135$, but closed freely at $\$ 140$ offered, with sellers at $\$ 145$. This mine appears to be "giving out", at an alarming rate. It is reported that the amount of bullion taken out at their uill, during the twenty days previous to Dec. 11th, was $9,381 \mathrm{Hbs}$. of amalgam, worth $\$ 225,000$. Comment is uncalled for.

Savage shares have declined a trille, and is quoted at $\$ 2,700$, with sllers at $\$ 2,750$. But one transaction is noted.

## Chullar alares have irnproved somewhat, witid less busiacs8

 that the presious week.B'otusi is luch firmly at full ₹?00 over last quatations. The injunction of the lirass Valley nganst this company was denied on the 14th iustant, which places the title of this mine beyond dispute. The latest nccounts from the wine are bighly encouraging; the indebteduess of the company is but a tritte, aud but small sutlay will be regquiroi for a thorough develnrement of the ground.
Hate \& Vorcors is comsilerably sought after at about \$1,0(\%), but is beld firmly at $\$ 1,100$.
Yellow Jacket has agoul market at $\$ 950$. We understand that a sample of very file ore at blue sulpharets, was received at the oftice: in this city, during the phat weels, from a now strike in this mine. This is sonethine new and a most promising fealure at so great a distance north of livid Hill. Nuch satiefaction is felt liy the stockholhers at the recent appointment of Mr. Jobn White, as Superiatendent of the mine. Mr. W. has had much experience as a mining superinten deut.
The lads Bryan Shares are exciting much attention at the present time, and have changed hands during the week to the extent of one fourth of the mine. Opening at $\$ 10$ these shares rapidly adranced, in consequence of exciting and farorable acecuits trum the mine, $\$ 191,2$ carh and $\$ 21$, in thirty days. We leam that rich blae sulphurets mixed
With wre siver has been met with in thins mine. only was needel, to lead to impurtant develupments in the Fivwery District, where the lady Bryan is located. The ing for this mine at the Roger's Mill.
Imperial Shares have been suld at $\$ 2.50$. The Company's bouks have been closed, to make as new issue of shares, two
fur one, and hereather the quatations will be made accurdingly.
Urerman continues stealy at $\approx 400$ to $\$ 405$. Sierra Nevada Shares have advauced to $\$ 80$. Dauey has declined to \$94, thirty days.
Nurth Anerican shares not much dealt in ; closing bids S58. Small tramsaction
Baltimure American, firm at $\$ 24$; $\$ 30$ asked.
Baltie shaves have been steady at $\$ 100 \mathrm{c}$ ( $\$ 110$, all paid.
North l'otosi shares in demand at $3.30(a) 32$.
Ballion, Golll Hill, first sold at \$43, and advanced to $\$ 62$ ju. At the cluse $\$ 5750$ bid, all paid

Hichigan Shares regular at $\$ 30$; Bajazette and Golden Era, at \$16. Grass Valley declined to $\$ 32$; Mit. Hope,
Guld $11.11, \$ 4$. Buruside shares have a market at $\$ 9,50$. Unien, Gold Hill, dull at $\$^{-}$; Nurton, at $\$ 5$; Pride of the West, in denund at $\$ 52,50$; Wide West, declinad to $\$ 57,50$; Utah, to $\$ 37.50$ thirty daps; Crockett, $\$ 2 \overline{5}$; Silver Hill, \$13.
Josephine. (Coso) $\$ 3$; Willow Springs, $\$ 2$; Sheba Shares steady at $\$ 15.5$ to $\$ 156$.
Melunos, declined to $\$ 70$, and closed at $\$ 75 \mathrm{bid}, \$ 80$ asked; Napolenn Copper Shares declined to $\$ 45$, and clused at $\$ 49$; Rhodes' Diggings, $\$ 6$; Mit. Bullion, $\$ 2$; Blue
Ledge, $\$ 7,50$.
We call attention to our report of Sales and report of Bids at the Stuck Board.

chuding all that relates to mines and mineral products of economical value ; the lourth, the tain such maps serctinus and other illustrations as were not introdured into the wther volumes, or printed with the tuxt. It is pers sithe, haweser. that some of these solumes
might have to be divited into two parts, owing to the large quantity of matter it mirh be desirable to pulatish. *** The appro printion tor the survey made for the second year of its continuance by the Legislature of
loti'g having just lo6' having just bern pad, a volume is now
due the Stite. Tho wurd has already been due the Stite. The work has already been
legun and will be carried on as rapidly as possible, provided the Board of Examiners will audit my estimates for the printing, to the extent authorized by the law, so that I cun make the necessary financial arrangements and be cuabled to pay for the work as it progresses by borruwing on the security of the
Staro warrant. $* *$ The printing of anothStaruwarrant. *** The printing of anoth-
er vulume of the report can be commenced whenever an appropriation is madn for the same by the Legislature and the money provided lor the purpuse.
Important to Miners.-The Supreme Court of Califurnia has just settled an important point concerning the right of locators of mining claims, and as the same state of circumstauces is very likely to again arise, we publish the decision as we fied it in the San Francisco Journal:-
Coleman et al. vs. Clements et al. is the title of a case wherin our Supreme Court settles some points which it is important to know. In February, 1861, three persons, in the name of themselves aud twenty-seven others, sume of whom knew nothing of the use made of their names, or of the intention to do so, took up and marked out a copper claim of 4,500 feet. Afterwards; in June, 1861, twenty-three of the original locators, with seven others, formed a new company and relocated the same ground, claiming that the original location had been abandoned by the failure of the seven lelt out of the new organization, to perform, as the mining law required "one day's work on each claim every thirty days from the lst of May until the 1st of December in each year." Five of the seven thus left out in the cold, brought sait to recover five-thirtieths of the claim, and the cause laving been appealed to the Supreme Court, that tribunal decides as follows :
That the claim is a joint one-that is, 4,500 feet, located in the joint names of thirty persons, and there is no location of any distinct portion thereof in the name of any one of them ; that it was therelore impossible for
each locator to do a day's work on his own each locator to do a day's work on his own
claim, and the law quoted, must not, in the absence of express terms, be construed as requiring him to do so ; that in cases of forfeiture, terms are to be construed strictly, and here the word "claim," which properly includes all kinds of claims, joint as well as separate,
means a claim held by individuals jointly, just means a claim held by individuals jointly, just
as it does a claim owned or held by one person. And one day's work, that is, the labor of one man bestowed ou a mere iudividual claim. On the point of adverse possession set up by defendants, the Court says that to make such possession available against a co-
tenant, there must be an iutent on the part of tenant, there must be an iatent on the part of
the tenant in possession to hold adversely, and such intent must be indicated by acts calculated to exclude complainants from all participation as tenants in common. The possession of one tenant in common is pre-
suned to be the possession of all, and this possession is not overtunned by the mere fact that the one in possession does not recognize his co-tenant. The judgement given in the Court below, in favor of complainants, is therefore affirmed."

The last idea of Paris, says one of the correspondents of the daily journals, is a plan in alto-relivio of the whole of Europe, nut in maps or models, but actuaily raised out of the gronud. A garden is to be s.t aside for the modeller, who, takiug Mont Blank, fifteen feet high, as his point de depart, is to raise in just proportion around in the rest of Europe, pour the seas into their proper places, and intersect the whole with roads, canals, railways,
and telegraphs. A steam eugine is to act the part of the moon, and regulate the tides.

## GEOLOGICAI SURVEI.

According to the Report of the State Goolugist, he is steadily and industriously pros ecuting, his impurtant and interesting laburs. In it he indicutes what is necessary to be done in urder to cuntinue the survey, and to perfect what has already ween done. The contributions to science, and tho iumediate and prospective advantages to our State, which it is believed will follaw a publication of the forthcoming volumes, will prove the wisdom of creating the ulfice of State Geologist and of continuing its existence.
There are only three counties in the State in which some work has not beeu done by the survey, and those are KImath, Humboldt and Mendocino counties, in which Iıdian difficulties have hitherto rendered it almost impossible for the small party to operate to any advantage, or without considerable risk.
Mr. Whitney says: "It seems proper, at the present stage of the surver, to thake some statement in r gard to the probable amount of time and money required to complote the work. Indeed, in my address before the last Legislature, I promised to do so during the couing winter. It is especially necessary that some action should be taken soon in reference to this matter, as the amount and character of the printing to be done this winter will depend on the settlement of the question whether the survey is to be
continued; if so, for what probable length continued
Undoubtedly, were the State in a position in which economy in the public expeuditares was not of the highest importance, there would be no question that the survey might be continued to an indefinite period with advantage, since all will ndmit that the results proposed to be gained by a work of this kind, if it be properly conducted, could not fail to be beneficial to the community. Thus, no ove in California objects to the minute accuracy and consequent expense of the coast survey work upon our shores, since the bur-
den of payment does not fall directly on shoulders. * * * The farth directy on our pleteness to which $I$ ever aspired to carry this survey was the completion of a map of the whole State on a scale of six miles to the inch, making nine-sheets, each abont three feet square, with the geology worked out on a correspond ng scale of accuracy. Further expericace in the State, and more knowledge of what the people expect, and a personal experience of the condition of the treasury, have convinced me of the impossibility of carrying out this undertaking, for which certainly not less than filteen years will be required. 1 am fully convinced that the work, carried to this extent of completeness, would be of sufficient benefit to the State to justify its being done ; but I am also equally well assured, in my own mind, that the people would not recoguize the value of the survey until after it was completed, and that, consequently, it would be impossible to carry it forward on a matured plan without danger, and almost certainty, of its being interrupted.
In weighing the matter carefully, I have concluded that four years longer is the extent of time to which the survey should be protracted, with a liberal appropriation-of not less than $\$ 41), 000$ per year. But I am, furthermore, of opinion that the survey should be suspended altogether, until such time as the finances of the state are placed on a cash busis, as I find that the delay and anxiety caused by the necessity of borrowing to meet the advances required by the treasury' being from one two years behind hand in the payment of the appropriations, is too disagreeable and prejudicial to the interests of the State and the progress of the work to allow
me to be willing to continue on the system any louger. * * * The result of the surver in case it should be actively contioued for four years longer, would probably be comprised in about five large volumes, of which the irst would embrace the physical geography and general geology of the State ; the second, the description of the fossils found in our rocks, both those of animal and vegetable origin; the third, the economical geology, in-

## THE MINERS' LABORATORY;

## KMPORTANT AND VALUABLE INFORMATION

Miners and Prospectors.

the science of mineralocy.
During the past few months we have been publishing a series of articles under the above head, in which we haveendeavored to collect such information as shall be of practical value to the miner and prospector, in their labors and explorations in the field. The early numbers, which treated upon copper, having been long out of print, it has been suggested by many of our recent subscribers, that we should reprint them for their benefit, and for the benefit of mavy of our old subscribers, who desire to have them collected into a single number. In accordance with these sug gestions, we give, in the present issue, so much of said papers as are of any special value. We shall still continue our Laboratory articles, and endeavor to render them, more than ever, an interesting and important feature of our journal.

The primary object of the science of minerology is the developement of mineral bodies ; a knowledge of their characters, forms and conbinations; also the circumstances and conditions io which they are found, and the substauces with which they are combined. 'This is the practical object of mineralogy and the point upon which we propose to treat principally in these papers.

A development of the nature of minerals, a knowledge of their elements, their properties and uses, constitutes the zconomical portion of the science, which though highly interesting and useful to mankind, is not a matter waich we propose to discuss to any extent. The miner is directly interested only in the developement-the bringing to the surfaceof the minerals of the earth ; their economy and general introduction into the various channels of business, he leaves to those into whose hands he delivers them in their rough state.

We know but comparatively little of the earth beyond the depth which has been reached by mining operations. This depth when compared to the entire bulk of the earth, may be correctly compared to the minute scratching and pin punctures of a coat of varnish on a 12 -inch globe. All beneath is mystery and speculation. Of this we shall treat more at length in future numbers.
A Mineral is an unorganized body, differing from an or ganized or living body in its structure, in the manner of its formation and of its i crease or growth. While organized bodies increase by means of their internal organs, which assimilate and retain in the system what is beneficial and reject what is useless, unorganized bodies increase externally.
A simple mineral sulistance, as pure gold, silver, etc., may be described as an organized body, presenting an aggregate of lesser particles of the same nature, united by affinity.

Every mineral possesses two distinct kinds of character, by one or both of which it may be distinguished from other subatances. These are termed the external and the chemical characters. Th former are commonly apparenc to the senses, and the latter are those which are developed during the chemical decompositions, which may be accomplished with or without heat. J'hese characters are denominated as follows : Aspect. or kind of lustre ; color; hardness ; specific gravity; streak; form ; structure ; cleavage ; surface ; tenacity and transparency.

Aspect, or kind of lustre, is very important, and is divid-
ed into metalic and non-metalic aspect; ther are often blended in the same mineral. Many minerala also mossess two distiuct kinds of lustre, une extel oally and the nother in. termally. The true metalir lustre may alway's we uistiuguish ed frum the metalic, pearly-adamantioce lusure, by its verug always combined with perlect opracity, aud by remaimang unaltered on the scratched surface.

Color is also of cunsiderable importance when combrined with metulic asject. In speaking of colur, in conucetun with minerals, the depth or shade of colur slould be carefully noted, and the peculiarity of shade expressed as near as possithle, by reference to some well known substance.The metalic colors are white, divided into silver and tinwhite ; grey, lead-grey and steel-grey, yellow, brass-yellow, bronze-yellow and goll-yellow ; black and copper-red.
Hardness is one of the inost important ut mineral characters. There are generally reckoned ten degrees of inardness: 1, yields easily to the nail. 2, yields will difficulty to the nail. 3 , scratches a copper coin, but is also seratched by it. 4, not scratched ly copper, but is not hard enough to scratch glass. 5 , scratches glass, though with difficulty, leaving its powder on it, and Jields easily to the knife. 6, scratches glass and yields with difficulty to the knife. 7 , does not yield to the knife, but does to the edge of a file, though with difficulty. 8 and 9 , harder than flint. 10 cuts glass.
Spechice Gravity - That is, the weight of a body compared to some other body of the same size or volume. This latter body is assumed as a standard; this standard is pure water at a temperature of $60^{\circ}$ Fah. A cubic foot of water weighs $997-136$ ounces-usually taken as 1,000 . A cubic foot of silver weighs 10,000 ounces; therefore we say silver is teu times heavier than water, and its specific gravity is $10-0$
Streak is a very effective character; it signifies the color of powder, produced by drawing or streaking a mineral across a file. The best way to distinguish the streak 18 to take a fine file, and draw it once or twice across the mineral, pass i lightly over your finger; when the color will be left thereon, and may be easily noted.
Fors is a character, when regular, of the highest interest, yet of limited utility in the discrimination of mimerals.
Structure and Cleavagr.-The structure of minerals is the mode of aggregution of the particles of which they are composed. Limellm structure is composed of broad, distinct concretions, of about equal length and breadth. Prismat'c, or bladed structure consists of long and narrow concretions, forming a trans tion from the lamellar into the fibrous structure. Fibrous structure, consists of fibrous, or very thin and capillary concretions, either straight or curved. Granular structire is composed of minute or small concretions, and appears to consist of one compact mass.
Surface. - The surface of minerals may be either uneren, granulated, rough. smooth, or streaked; streaked surfaces often arise from a close fibrous strncture, or otherwise indicate the direction of cleavage planes.
Tenacity.-The following are the different degreess of tenacity:-Brittle, such as grate under the knife, or fly off in the lorm of powder when attempted to be cut; and break into powder when placed on an anvil and struck by the hammer. Malenble or ductile, the property possessed by minerals which may be cut by the knife, and which flatten into spangles under the hammer

Transparmey.-'Lhe following are the degres of transparency, or trausmission of light, as possessed by minerals : 0 , Opaque. 1, Translucent on the edges. 2, Translucent. 3, Semi-transparent. 4, Transparent.
Degref of Lustres is distinct from the kind Justre or aspect of minerals. The degrees of lustre are marked by the following numerals : 0, Dull, devoid of lustre. 1, Glimmering. 2, Glistening, or weakly shining. 3, Shining, as rock crystal. 4, Splendent, or strongly shining, as galena.
pearance of the surfaces produced on breaking a mineral in
any direction, except in that of its natural juints or cleavare any direction, except in that of its natural juints or cleavare
planes, which ought to be always smooth, and nore or less Fracture is a character of minor importance; it is the ap shining.
Form, Frangibility, Flexibility, Todch, Somina and Sound, are all terms which are sometimes employed to deseribe the characteristics of ininerals, but as they
portance to the geveral student, we pass them by

Taste is a characteristic properly possessed by such minerals as are soluable in water.
MasNetism is a characteristic of limited application, but in many cases a very important one. I'he only metals which
attract the magnet, are iron, uickel and cobalt ; and there are very few that affect it in their natural state, but may do so after their exposure to the action of the blow pipe.

Electrictry.- To ascertain whether a mineral possesses
this character or not, a small instrument called an electrothis character or not, a small instrament called an electrometer is necessary. Electricity is produced in minerals,
either by heat or fr ction. To try if a mineral possesses the property of electricity, first rub it briskly for a few minutes with a woolen cloth, and thee present it to one of the eltrometer; or, heat it gently through and do the same ; if in either case it attracts the ball, then it pos sesses electricity.
The effects produced on minerals by the action of acids, are very important. 'Thesa effects are efervescence, solubility, partial solubility producing a gelatinous nass, \&c. To develop these effects, the mineral should be reduced to pow-
der, and placed in a small test-tube or other vessel, and the der, and placed in a small test-tube or other vessel, and the
acid, either pure or diluted; must be gently poured over it. The application of heat is sometines necessary, in which case a spirit lamp is made use of, and the mineral and acid supported over it in a test-tabe, watch-glass, or small capsule of Be.
The treatment of minerals by acids will be fully explained in its appropriate place.

## mingrals.

We have already described a mineral as an unorganized body, formed and enlarged by an inctease of particles, externaily ; said particles being attached by mere justr position instead of assimilation, as is the case with vegetable and animal organism. All solid substances therefore which pos are minerals, and the chief part of soils are mineral.

When a mineral has a metal of any kind associated with it, it is commonly called an ore-as an ore of silver, an ore of lead, copper, etc. Ores are usually found in veins, sometimes, however, in beds. A mineral bed usually lies orizontally, or at a very slight inclination. Lead, zinc and iron are often foun
very seldom.

## minerar veins.

A mineral vein may be described as a fissnre or crevice in the earth. more or less vertical, and filled with some kind of vein-stone, usually quartz, more or less mized or impregnated with various metals, and when so mixed, called ores. Most metalliferous veins contain several varieties of metals. The veins of California and Nevada Territory probably contain a larger variety of metals than those of any other portion of the globe, Veins rary in width from a fraction of an inch
to one or two hundred feet. They usually range from 10 to one or two hundred feet. They usually range from 10
inches to two or three feet in width. Of the origin of veins and the manner of their being filled, there are various theories. The opinions of practical and scientific writers on this subject are quite various. Some attribute these fisures to a process of cracking or opening of the earth in long fisures by some interior power of upheval; others attribute their formation to a contraction of the earth's crust in the process of sult from the action of electr cal currents. Their manner of filling up is also a matter of great diversity of opinion. Infilling up is also a matter of great diversity of opinion, Intrical agencies, etc., are among the most commonly entertrinal theories. The probability is that all the agencies named have contributed at times and in part in a greater or less degree toward preparing these valuable deposits, so indis peusable to the progress of civilization and the arts. Ouv present purpose, however, being to treat upon facts, we shall warks to simple facts and positive instruction. In future marks to simple whall probably have something to say on the var rious theories above alluded to.

## general laws of teins.

Whatever their origin these veins (or lodes as they are sometimes and perhaps more properly called) are, as a gen-
eral thing, found to obey certain general laws. They are eral thing, found to obey certain general laws. They are
usually contained within clearly defined walls, and are generusually contained within clearly defined walls, and are gener-
ally found in "setts" or "classes," each indiridual of any givally found in "setts" or "classes," each individual of any givThe different setts usually give evidence of different ages, the newest sett being found to have disturbed or displaced the older in passing across it. The different setts are usnally known by the general line of their direction as the "Eas and West sett of veins," or the "North and South sett of veins." They are usually found most productive near their cross.
class of rock, a a change in its mineral productiveness may be
most confidentiy expected. The point where a "leader" or north and south; the east and west series of veins is m ore string cowes in is usually improved by such contact. On recent and may be called secondary not caused by the coning ingement of a lode, where it is Mr. Remond of this city, who las paid much attention to not caused by the coming in of a feeder is almost invaria- the geology of the quartz veins of this state, remarks that
bly attended with comparative barreness. The scatiering of $\mid$ "the metalilerous character of the secondary quartz veins is lode into a number of small unes is almost universally, worthy of note. They bear gold, often iu crystalized form. anfarorable. They are, of course, of more recent origin which is very yarely tije case in lodes running north and than the rock which they traverse, through their general claracteristics and richness in mineral is often much affected by their passage from one class of rock to another. This latter fact would seem to imply that, to a certain extent, they
are dependent for their miueral valite upon the mechanical conditiou of the rocks which they traverse.

## true veins.

As we have already stated, veins or lodes are found traersing all kinds of roeks, stratified and unstratified, often passing from one to the other. They are also sometimes treen the slate and granite, metamorphic (rock changed by heat) and unchanged rock. Veins of this description are usually called "true veins," because they are much more reiable, more clearly defined, of greater linear extent, and gen erally mach larger than veins having both walls composed of
the same kind of rock. It is reasonable that these conditions should usually accompany veins of this description inasmuch as fissures between walls of dissimilar rock would naturally preseat less objections and distarbunces and be more coutinuous in both leugth and depth, than fissures forced through a homogeneous mass of roek. True metaly
liferous veius are almost uniformly much more productive hferous veins are almost unitormly much more productive
than other veins in the same neighborhood. The Comstock rein, in Washoe, is of this description. This is a condition in regard to quartz veins which should be more generally considered thau has heretofore been the case in this country It will, wherever it exists, be found to exert a most impor tant influence on the productiveness and consequent value the vein.

## igneous indications fatorable

Valuable metaliferons veins of ore are often found in secorndary and even tertiary formations, jet as a usual thing, they are found more universally productive and most reliable when they occur in the older and metamorphic rocks. Cerritore the proof of this in our own State and adjoining Slope, where is found the strongest evidence of ancient igueous action, have as a general thing. proved most valuable, in mineral developement. Iudeed, the idea has been advanced by some, that no metalliferous veins exist entirely disconnected with igneous rocks. It is claimed by the advocates of this theory that whenever surface indications are wanting, metamorphic socks will invariably bo found at no great depth below.

## pecollartities of gdartz veing.

The siudy of quartz veins, to the mineralogist and miner, is most interesting and important, and one to which quite too
ittle attention has been devoted in this country. In the hasty summary we are now giving, we cannot do the subject that justice which its importance demands; but in futare nunbers we propose to come back to this head and treat more fully upon it.
ce. The action of their true characteristics upon the sur the oxidation of much of their contents, and other disturb ing influences upon and proceeding from the surface, not unrequently lead to serious fallacies in judging of a vein in the early stage of its development. An important consideration in the study of veins is tue changes whech they undergo in their passage from one cla s of rocks to another.
l'his matter, so far as we have learned, has never been mucl This matter, so far as we have learned, has never been much
cousidered on the Pacific Slope, although it has long been acknowledged as one of much importance in nearly all other mining regions. We append the result of a few observations under this head from varivus authorities.
De la Beche in his survey of Cornwall says that granite and its modifications is always found near or all locations prodnctive of paying tin or copper mines; while lead, anti-
mony, iron and zine are found independent of and at a dismony, iron and zinc
In the Hartz montains, veins passing from hard to soft lates lose much of their productive character ; hard gramtes, as a general thing, are also found less productive than soft decomposed descriptions.
In the Copper mines of Lake Superior veins in hard greenstone are usually contracted and comparatively barren; but the same veins on entering the granular trap, a much more yielding material, becomes at once expanded, and improved in yield. North American mines. The Copper Fulls mine is highly productive und well defined in the trap, but mere fissure. Nearly all the veins of the Lake Supeiror region traverse different mineral planes, and in their passage It will be perceived that instances above cited confirm the correctness of our previous remark with regard to the favorable nature of igneous rocks in mineral localities.
We hare stated that veins are usually found in "setts" or clusters. Califurnia is no exception to this rule. The gen-
south. The ummorous threads or miuute veins crossing them contain much galena, in small leaf-shaped masses, and sumetimes in cubic crystals, with more ur less silver. These
lodes ulso contain muclí white iron pyrites, with some arsenical and copper pyrites.

The following paragraph, whiclf like the one above given, Pacifique, and, prophetic at the time, has been fully rerified by actual discoveries.

The combinations of these different metals suggests the possibility of the discovery of silver mines. Some speciarens taken from the quartz nines of Soulsbyville, resemble mixe mixed with lead, iron, arsenic, copper and a little antimony, the metals being in a condition of sulphurets. At Soulsbyville, the iron and lead predominate, and the other metals are in, smaller quantities, with a total lack of antimony.
No other portion of the world has been so carelully studed with reference to its metalliferous formations as Cornwall and Wales, and it has been asserted with much cunfolence, that a description of these veins would, generally globe. So far as their divection, length, depth, and dip are with regard to their contents, we apwrehend quitedistinctive characteristics will be noticed. No No one who has acquainted aimself with the quartz veins on the two slopes of the ficra, can have fuiled to notice most marked and distinct cham creristics between the two. Uther peculiarities may be noiced between those and the vems when are found far out toward the interior of the "Great Basin," and others still
more marked when we reach the opposite rim of the Great Basin in the neighborhnod of Pike's Peak, as will be seen from the following extraet which we gave in our issue of April $20 t h, 1863$, from a correspondent of the T'erricorial "Thpize
"The Pike's Peak ores contain no quartz. They are iron pyrites, more or less maixed with copper pyrites, lead, antimony, etc. * * * On sinking upon this no veinstone whaterer is found. The vein is a

In fact almost every vein has much that is pecnliar to itelf. Perhaps the most simple of metalliferous veins are hose known as "gold-bearing," and it is to those, almost exclusively, until within a short period the miners of Calitornis, have chiefly paid attention. Untilafter the wonderful developments of the Comstock lead in Wasthoe, not one prospectany other mineral than gold, which is alnost always found pure and free, and consequently readily known to the most unpracticed explorer. Hundreds of veins, in California, now knuwn to be of the highest value in silver and copper, were,
in the early days of our mining experience, passed, by as in the early days of our mining experienee, passed, by as
worthless, simply because they did not "show gold" in workng quantities.
ery few of our readers are ignorant of the ordinary indications by which the probable presence of quartz veins is noticed, or the manner usually employed in discovering their locality, or tracing their direction whenever found; hence we will not weary their patience by giving details so generlly known.

In examining into the phenomena of quartz veins on the Pacific Slope, it should be borne in mind that but a very imited time has elapsed since the first efforts of minirg were andertaken here. On the eastern continent and especially n Cornwall and Wales, mines have been wrought from time immemorial, and yet scarcely a year passes withont adding ap by the generations who have lived aud died in studying the theory of those mines, the details of their stiucture, the relation of those veins to the various ores which they contain, and to the enclosing rocks, etc, etc.

Many of our citizens complain of the apparent dilatori ess of our State Geological Survey, from the fact that one miners are not already put in possession of facts for which angish miners have patiently waited whole decades, and or which the English Government has purd an hundred fold more, than our Commission has yet asked for. Such perapon the solution of the various problems presented in the investigation of 80 complex a subject as the study of
such a wide and varied mining field as is found near and within the boundaries of the State of California.

## COPPER.

The recent discovery of numerous and valuable veins of copper, throughout the entire length of the State, and the onsequent especial degree of attention which is now being rawn to this new interest, has induced us to vary, to a cer cession of subjects, in such a paper as we have commenced. And in accordance with numerous requests to that end, we copper, which can be of any practical value to prospectors after, or workers in that mineral.

## the gempray of comper.

In referring to the comburical conditions under which cop-
eor is found. we shatl combence with (onnwall. a distriet curnishing hearly one half of all thes tin and copper prostaced

 oeen protraded thruarh shates ly igneus agonces from be
low. The general directiou of the copper vins is enst and West, and nearly at right anoles with the tin lucles. The ores
of cuppre and tin are seldon found in the sanse vein in CornFall, and neither metal is uften found in very great abundanec at a lass depth than so or 100 foet below the surface.
cupper veins in that district have boen traced several miles -in une instances seren, without any evidence of discoutinu-
ance even at that point. No persun has ever yet seen the ance even at that point. No persun lase ever yet seen the
buttom of a rein of either tin or copper. Ihe ores found
there are wavally the ydlow sulpharet of conper and iron there are wavally the yellow sulpharet of copper and iron. ret, red oxide, and native copper. The general averuge 0 these veins is aluot 2 'a per cent., hut which by dresing
actually brought to about eight per cent. brlure smelting.

Frasife affords but one workable mine of Copper. Nu merous mines have been wrought at varions periods in the past, but, we believe, with the above cxcrption, they has all been anmadoned. The coplprer veins of this country are
eserywhere found assuciated with aluminous slates, muro or less metamorphic, and among which, at frequent intervals, porphyritic rocks have heen protrudgd. The mines at Ches sy are directly at the line of junction of the granite and lias (the latter a species of limestone.)

Gbrmany,-The Copper Bines of the Eartz mountains occur in grauwacke slute in'o which aumerous belts of trappean rocks have been obtruded. The mines of Rheinbreitenbach are in the same character of
ductive in pyritoos variega ted copper.

Spark. - The general character of the deposits of this metal in Spain, is similar to those of the Martz mountains. In the Province of LIxeloa is a district of much mineral wealth, the formation of which is clay-slate, traversed by unmerous porphyritic eruptions, and it is near the line of con-
tact of the slates and porphyry that nearly all the metaliferous veins occur-the most valuable being directly between the two formations, having a wall of schistose slate on one side and porphyritic granite on the other; the former usually composing the stuth wall aud the latter the north wall of the veins. The veins are often found with both walls of por-
phyry, and sometimes, though unfrequently, with both of slate.

Prussia. - In the vicinity of Mansfield, in Prassia an interesting deposit-occurs, known as the "K eepferscheifer," or copper slate-a thin layer of which occurs in magnesian lime stone. Thronghout the entire body of this
slate" is disseminated gray argent ferous copper ore.

Near Schemnitz, in Hungary, is an interesting metalliferous region, which produces about 5,000 tuns of copper annually. The veins of this district are found altogether in porphyritic rocks, connected with sienites and passing into prate of barryta. The ores are pyritous and gray copper.

Norway and Swerden.-The veins of these countries are almost exclusively coufived to the gniess and mica slate, more or less metamorphic trom subterranean heat. The copper of
this region is highly esteemed in consequence of its purity this region is highly esteemed in conseque
and freedom trom arsenic and other metals.

Russia.--The copper deposits of Russia, in the Ural Mts., are also remarkable for the purity and richness of their ores The copper ores of this regiou are found chiefly in thin veins and nests of malachite, which lies in a broken, unconsolida. ted mass of detritus, overlying the surface of the upturued
edges of limestone strata, intermixed or rather intercallated edges of limestone strata, intermixed or rather intercallated
with ridges or ledges of tra: pean rocks. I'his malachite, though not in immmediate contact with trappean rocks doubtless owes its origin, indirectly to igneous action, being prob ably a secondary product resulting from cupriferous sublima tian, accompanied by stalagmite deposition.
Cuba.-The copper deposits of Cuba, like those in the Ural Mountain region, are not in regular veins, but in masses, in immediate connection with igneous rocks, such âs gveenstone aud serpentine. The gangue of these d posits is composed of quartz, and common white marble. The ore con-
sists chiefly of yellow sulphurets, although blue carbonate of sists chiefly of yellow sulphureta, although blue carbonate of
copper is not uncommon.
Cails.-The copper mines of this country are very numerous and of great value. They exist chielly in metaworphic granite, with veinstone of quartz and jasper.
In Australia the mines of copper are situated in an association of rocks quite similar 10 those formed in the Cornwall copper districts. The Barrossa district is in mica slate, similar to the killas (slates) of Cornwall. Through these simuar to the kilas (slates) of Cornwall. and sienites have
slates, as in those of Cornwall, granites and slates, as in those of Cornwall, granites and sienites have
been protruded, at frequent intervals. On the Copper Mine River, the enclosing rock consists of trap and sandstone with occasional layers of limestone.

In Lnter Cafifornia and Carmen Islands, we learn from verbal communication that the enclosing country of th

From the above data it will be seen that copper ores are
found in almasall all pusitions, from the most recent clay slatens tact with or in the inmellate vicinity of ignouls or he to morphic rocks. Perhaps no metal precent more uniforme er-
idence of an oriyin deriwed from an ignems navency than idence of an migein derived from an igneuts ngeney than
copper in its various ores. Of sto origin we shall speak at a future tine.
With the excer tion of irnn no metal, used extensively in the arts, is more generally distributed than copper. 'There is seurerly a known country on the globe where it bas not been found in workatble quantities
It is hurdly necessary that we should occapy space in a journul for Culiforuia readers, to direct them how to find or race a mineral vein; yet a few brief bints to aid the prosnector in determining whou he has found a copper vein may not be out of place.

## TO TEAT COPPER ORE.

Perhaps there is no characteristic of copper veins so general as their color. Whenever a mineral of a green or blue color is met with the presence of copper may be reasunably suzpected.
A very simple and ready method to test the presenco of copper in any ore is to drop a little nitric acid upon it, and after a short time dip a feather into the acid, and wipe it
over the hlade of a knife. If there be tho least quantity of eopper in it, the same will be precipitated on the knife. P'erbaps a siupler mode than this cannot be named.
A Bluw-pipe test may readily be made as follows:--Place a small piecce of copper ore, with a little borax on a piece of charcoal, and apply the flame of a blow-pipe, when if any copper is present it will soon show itself in a small globule.

Again take a small quantity of the ore and pulverise it; place the powder in a small vial, add three or four times its bulk of nitric acid, which will soon dissolve the powder; then add a little water, and dip the point of a knite, or any piece of bright iron into the liquid. If copper is present the iron will be found coated with it.

## MUNDIC-PYRITES.

One of the most common characteristics upon and near the sarface of a vein of copper is the appearance of large quantities of Pyrites-sometimes called Mundic. Whenver this mineral is so found, in great abuudance, especially $f$ in a region productive of copper, the miner may have the utmost confidence in prosecuting the work of developing his vein. Pyrites are most usually yellow, varying from nearly the color of gold to an iron white.
Pyrites sometimes contain, mechanically mised, small uantities of gold. They are then called "auriferous pyrites." the sold mines of Califurnia contain large quantities of this description of mineral, and thousands of tons are now being worked for this metal. They are, here, usually concentrated from the sands which have passed through the ardinary gold processes. One of the most extensive and perhaps the most thorough establishments for working auriferous pyrites, is that carried on ly Mr. Deetkin, a short distance from this that carried on by Mr. Dectkin,
city, on the San Bruno road.
Comper pyrites constitute the principal ore of that mineral, and frequently occur very massive, occupying the entire width of a vein, sometimes many feet in thickness, but oftener in strings and bunches comprising but a small percentage of the entire content of the vein. Copper pyrites is not considered a rich ore. The yield of copper is usually from 8 to 20 per cent, rurely reaching 25. The richness of this ore may generally be pretty correctly estimated by its efllor. If of a
fine yellow color and readily yielding to the hammer it may be fine yellow color and readily yielding to the hammer it may be t may be set down a sa poor quality of ore. The color und consequently the value of this ore is attributable to the more less abundunt presence of iron.

We hear much said among copper miners and prospectors for copper, about "gossan," and furthermore that the appearance of gossan is a good indication of copper-and so it
is. The question is also often asked, "What is gossan?" Gossan is nothing more nor less than decomposed mundic. or iron pyites. It is usually of a yellowish culor, sometimes, however, approaching to dark red. The more gencral composition of gossans oscilates between the two ex-

|  | No. 1. | No. 2. |
| :---: | :---: | :---: |
| Quartz. | 10 | 85 |
| Water, etc. | 10 | 3 |
| Oxides of Iron | 80 | 12 |
|  | 100 | 100 |

The term, gossan, originated in Cornwall, and for a time was local, but is now guite generally used in this country also. The existence of mundic or its common resultant, gossan, is not universal. In some rich mining districts no iron, ery little at most exists in the veins; in such, the ferru-
ous stain is wanting and gossan is not seen.
In Califorvia, we presume, from copper fxplorations thus far made, and from the general character of all our quartz veins, gossan will be almost universally met with, and whereever it or mundic is found, rich and valuable ores of copper, and possibly of tin may be confidently looked for at depths
rangiag from 15 to 100 feet beneath. Gossan, of itself, is ranging from 15 to 100 feet beneath. Gossan, of itself, is
generally of but little value. Althongh it sometimes congenerally of but little value. Althongh it sometimes con-
tains small quantities of both gold and silver, and not unfre.
quently copper. It is often found, in small quaditice, far
duwn on the vein, Bemoth vein.
Bemeath the enssan, we freguently wherve appearances (or procurng copper frem a solution of shl hate of copes 'I lee pare metal is fathered lugether in chinks, and cavities between the main muse of forsan and the herty of the undecomprosed chpper pyrites, minglitg preftapis with the lomor prart of the former. Fometimes this mative copper, as it is called, may retan its metalic character; but at whers it becomes convertedinto on oxide, and this again into a carbonate, ly the percolation of waters containing common air and carbonic acir.
With regard to the formation of this native copper, it is probable that the sulphur, by a union with the needful oxygen, becomes sulphuric acid, and that, this tormed, the copper is attacked and removed, to be dealt with like any other solution of the sulphate of copper.

We can hardly conceive it possible that the copper from a fuid state, has been forced up from below like dikes of porphyry or greenstone. An elastic force sufficient to raise 8 fluid mass of three times the density of lava would shatter the enclosing walls, and furce the copper into the tissures. If this were its origin, we ought to find it occupying the depressions in the surface rocks in the vicibity of the fissures, like modern lava carrents.
We find the the copper investing varions crystalized minerale, and every wave and stria of the pre-existing crystals is faithfully represented, it is impossible by any artificial method to oast this metal so as to exhibit such minute linee. They are as delicate and faithful as could be obtained by the elec trotype. Again the associated minerals do not exhibit the effects of a high temperature. Also, if the contents of the veins were the result of injection, their productiveness would be unaffocted in their passage through different mineral planes, Lastly, copper and silver combine in indefinitè proportions, forming homogeneoas compuands ; and yet we find them existing side by side a most chemichally pure. Admitting that they once formed a homogeneous compound, it is reasonable to suppose
tro-chemical agency.

The ores of copper are quite numerous and present a great diversity of appearance, yet they are all very readily distinguished, each from the other, by certain unmistakable characteristies, which are rendered familiar by a very little attention. The presence of copper in any ore having been determined by the "test" above given, the character of the ore can, in most instances, be determined by the following description:

The ores of copper are divided, by metallurgists, into 13 different classes, and each class is subdivided into many varieties. The richest of the ordinary ores appear under two general aspects : the first having a metalic lustre of copper red, brass yellow, iron or blackish gray, at times inclined to blue; the second is without metalic appearance, of a reddish color. verging upon purple, blue or green, the last being the most usual tint. The classes of ore most frequently occurring are Native Copper, Sulphuret of Copper as Copper Pyrites, Gray Copper, Suluhate of Copper, Oarbonate of Copper and Arseniate of Copper. The most common are sulphurets and oxides, the former being the most abundant. Sulphuret of Copper occurs in all considerable copper diatricts, and is abundant in California. The color of this re is a blackish lead gray, approaching, at times, to tarnished blue green. It is considered one of the richest ores, and generally occurs in very beary veins.

Copper Pyrites greatly resemble in appearance, sulpnuret of iron, common in the gold bearing quartz of this State. The color of the Pyrites is brass yellow, subject to taraish, with greenish black streak and uneven fracture. Oopper Pyrites are readily distinguished from iron pyrites, which they greatly resemble, by their inferior hardness ; they may be cut with a knife, while iron pyrites will strike fire with steel. A marked difference may also be noticed in the effects of nitric acid upon the two substances. They do not form so rich an ore as sulphurets. The richness of the pyrites may generaily be judged of by their color. If they present a fine yellow hue, and readily yield to the hammer, they may bo cousidered a good ore; but if they are hard and of a pale yellow color, they are mixed with iron pyrites and consequently comparatively barren of copper and constitute a poor quality of ore.

Carbonate of Copper is of a blue or light green color, with
ale green streak. It often occurs in beautiful green eryspale green streak. It often occurs in beautiful green erys-
tals. It is also known as Malachite. Green Malachite or Green Carbouate of Copper admits of a high polish like marble, and when obtained in lurge slabs, is often formed into tar bles, mantle pieces, etc.

Arseviate of copper is of various shades of olive green, and sometimes occurs in beautiful blue crystals. It readily melts before the blow-pipe, throwing off funes of garlic odor This ore is but little worked.
Gray Copper ore is of a steel gray color, more or less
deep, either bright or dull. The value of this ore is often deep, either bright or dall. The value of his ore is often
very materially increased by reason of the silver which it entains. It is generally accompanied, to a greater or less Suiphate of copper (Blue Vitriol,) is similar to the artifi-
cial salt of the laboratory．The water flowing from mines of＇it will probably be with this description of ore．When so this ore has a blue tint，caused by the solution of this salt．fuand it is usually in about the following proportions：－Cop－ Copper is easily oltained fron this water，in a metalic state by depositin！pieces of scrap iron in it．
［＇The ores above named are about all the ores of copper worked to any considerable extent．］

Native Copper occurs in crystals，branches，and filaments， its most common locality being in prinitive rocks．It is found abundantly in Siberia，at the mines of Tourinski，in those of Hungary，Sweden，Cornwall，\＆c．The gangues of native copper are granite，gneiss，mica－slate，clay－slate，quartz， carbonate or fluate of lime，sulphate of harytes，\＆c．
Red oxyde of Copper is deep red，sometimes very lively，es pecially when bruised．It is friable，difficult of fusion at the blowpipe，reducible on burning charcual，soluble with effer－ vescence in nitric acid，forming a green liquid．
Black oxyde of Copper is of a velvet black，inclining sometimes to brown or blue；and it acquires metaliclus－ tre on being rubbed．It is infusible at the blowpipe．
Hydrosilicate of Copper consists essentially of oxyde of copper，silica，and water．Its color is green ；and its frac－ ture is conchoidal with a resinous lastre，like most minerals which contain water．
Dioptase Copper，or Emerald Malachite ；a beantiful but rare cupreous mineral，consisting of oxyde of copper，car bonate of lime，silica，and water in varying proportions
Phosphate of Copper is of aw emerald green，or verdir－ gris color，with some spots of black．It presents fibrous or tuberculous masses with a silky lustre in the fracture．It dissolves in nitric acid without efferrescence，forming a blue liquid i melts at the blowpipe，and is reducible upon char－ coal，with the aid of a little grease，into a metalic globule． Its powder does not color flame green，like the：powder of mariate of copper．
Muriate of Copper is green of various shades；its powder imparts to flame a remarkable blue and green color It dis－ solves in nitric acid without effervescence ；and is casily re－ duced before the blowpipe．Its density is $3-5$ ．By Klap－ roth＇s analysis，it consists of oxyde of copper 73，muriatic acid 10，water 17.
The copper of Lake Superior contains about 3－10ths of one per cent．of silver．The copper of this State，mostly if not all，doubtless contains an appreciable quantity of both gold and silver．Of this we shall probably receive more definite knowledge when full returns are received from ores which have been sent East for reduction．A little metallurgical knowledge will be lound of vast importance to the miger everywhere，and especially in California，where the mineral deposits assume such unprecedented profusion．Our miners deposits assume such unprecedented profnsion．Our miners liar with copper ores，as they have，for the last ten years， been with gold．
the comparative value of some of the most common of the

## ores of copper．

Native Copper generally occurs almost pure，and in al－ most every cunceivable form，as massive，grauular，filiform （thread－like，）arborescent，in thin laminæ，etc．When found associated with other metals，such as silver，for instance，the two metals usually occur in juxtaposition，simply，and not combined，a condition which they readily assume when melted together in the crucible．
Sulphuret of copper is very rich ore，yielding copper 76．5； Sulphur 23；and iron ．5．
Red Oxide of Copper is a very rare and rich ore．Very little，so far as we have learnerl，has yet been found in this State．When free from earthy impurities its yield is 88 ＠ 91 of copper，and 9 ＠ 12 of oxyg＇en．

The Black Oxide of Copper，in its pure state yields from 70 ＠ 80 per cent．of copper．Both the black and red nxide yields readily in the reducing flame of the blowpire a globule of copper．
Variegated Copper Ore（Peacock Ore）gives 50 ＠ 56 per cent．of copper，and promises to be quite common in the mines of this State．
Copper Glance，or Redruthite yields from 70 ＠ 75 per cent．of copper，when quite pure，and in that condition may be readily melted in the ordinary flome of the candle．
It sometimes，though rarely．occurs in connection with Bis－ muth，when it falls as low as 18 to 20 per cent．＂
Antimonial Copper is neither very common or ricb．It yields $20 @ 75$ per cent．of copper．An ore of the latter
yield occurs on the Colorado，near Williams Fork，in this state．

Green Carbonate of Copper（Malachite）in its pure state contains 75 per cent of copper．

Biue Carbonate of Copper is usually a richer ore than the green and contains from 65 to 70 per cent．of copper．

Gray Copper，is a very rich and promises to become a quite conmmon ore，in this State．Its yield of copper is from
40 （a） 50 per celt．This often contains as high as ten per cent of silver，and sometimes a small quantity of quick－ silver．

Copper Pyrites is the most abundant of the ores of copper and usually ahout the poorest．Its yield is greatly affected by the presence of irou and varies from 12 to 30 per cent． sarely，however，reaching 25.
If in is ever found associated with copper in Califo，nia
per $30 ; \operatorname{tin} 26$ ；irou 14 ；sulphur 30 ．
ndications of tin pyrites－associated with coppler．
Tin Pyriles occurs massive，like copper；its lustre is me－ talic with streak black；color from steel gray to iron－black，
sometimes presedting a blueish tarnish，with an uneven frac sometimes presenting a blueish tarnish，with an uneven frac－
ture．When heated in an open tulue it gives off sulphnrous fumes，with a slight sublimate of the oxide of tin．On char－ coal，with the blow－pipe，the sulphur is first expelled，after which a dark scoriaceous（partaining to dross，like the dross or scoria of metals）globule is obtained．The charcoal will also be coated with the oxide of tin．With soda，a globule of im ure copper is ohtained．
This species of pyrites may be more confidently looked for in a granite rather than a slate reg on．Copper miners will do well to keep a good lookout for this mineral，as，if found it will be a valuable ore．
Arsen cal Copper．（Domeskite）which may be known by its eniform and botryoidal appearance，（reniform，having the shape or form of kidneys；bot ryoudul，shaped like a bunch of gapes）is a very rich，though somewhat rare，ore．It yields， when pure，about 70 per ceut．of copper，and 30 of arsisnic． Its compusition sometimes varies so as to bring the copper as low as 60 ，with arsenic 20 ，and 20 parts of irou and sul－ phur．
Sulphate of Copper yields about 25 per cent．of metal，and occurs irregular in shape and in three－sided crystals，with a lossy lustre，approaching the sky－blue，in lustre．Tbis min－ ral is often fouvd dissolved in the water which issues from the mine．The copper from these waters is obtained by pre－ cipitation with iron．At a mine in Wicklow， 500 tons of iron were laid at one time，in the pits into which the water was collected，and in about twelve months，this iron was all decomposed or disolved，and each ton of iron was found to have deposited two and a half tons of a reddi－h mud，which was an＂xide of copper，and which upou proper treatment yielded 15 cwt of pure copper to each ton of oxide．

## MINING STATISTICS．

The value of mineral products in Great Britain，in 1855， amounted to one hundred and sixty－one million dollars，and When prepared for manufacturing purposes，$\$ 190,000,000$ ． The relative proportion of which coal appears to amount to 49 per cent．；clays，slates and sundries， 23 ；Iron 13 per cent．； Copper 8 per cent．；Lead 4 per cent．；Tin 1 per cent．The production of iron increased 300 per cent．in 28 years，end－
ng prior to 1855 ，and anounting to $31 / 4$ million tons．The average per cent．of copper fur ten years，ending 1785 ，was 12 per cent．；for ten years ending 1855，71／2 per cent．；for 1857 was $63 / 4$ per cent．These figures clearly indicate the eco－ nomical value of improvements which have been effected in the working of he mines．The number of people employed in these adventures，was 304,000 ，of which 91,1100 were fe－ males，and those under 20 years of age．The number of these adventurers 3,271 of which there is 172 copper vein
leads， 330 tin， 156 residue ： 11 coal and iron mines．When we talke into consideration the enormuas amount that is real－ ized to the Kingdom of Great Britain trom her mineral re－ sources who can predict the future of the Pacific coast，with the existing facts in view whilst the character of our mines is much richer and we can multiply the ir metalie veins by
tens of thousands by the assistance of a Pacific Railroad and tens of thousands by the assistance of a Pacific Railroad and
time sufficient to develop the resources：：The Pacific slope will，in less than 26 years，produce more in value of the pre－ cious metals than the bulance of the world．－［Marysville Appeal．
Shory Chimeys．－A correspondent of the London Buider gives the following cure for a great and common

I have built many chimneys in all possible situations，and ave found one simple plan everywhere successful；the only secret being to construct the throat of the chimney（the part just above the fire－place）so small that a man or boy can barely pass through it．Immediately above，the chimney should be enlarged to double its width，like a purse，to the extent of about two feet in hight，and then diminished again to its former proportions．No chimney thas constructed will ever smoke．

The Copper Smplters of Swansea are crowded at the present time with orders：．The recent advance in the price of copper has given a new impetas to the working of the mines．The mining interests of Great Bri ain，generally， were never so flourishing as at the present time．Bura copper is quoted at $£ 100$ ；Rapuda at $£ 102$ and Chili at $£ 90$ ．Iron has largely advanced with confirmed and increasing demand． Buyers in the metal market，at latest dates were operating freely，and there was every prospect of prices being main－ tained．Much confidence was also felt that a further and considerable rise will take place．
Riverside．－This is the name of a new＂city＂just laid out in Keys＇Mining District，Owens＇s River，ninety miles south of Aurora，and fifty miles above Bend City．

## PRICE OF GOLD．

We observe，says the Mercantile Gazette of the 22d inst． from the tenor of some of our recent Eastern exchanges that more reasonable views are being entertained in regard to the advance in Gold．Instead of attributing it so largely to the movements of speculators and heuping maledictions upon the ＂Gold mongers，＂they are now willing to admit that under all the circumstances，the marvel is not that Gold has ad． vanced，but that it has not adranced more．The large ad－ verse balance of trade－the light export requirement for our surplus products－the dwindling of Giold receipts from Cali－ fornia－the continuance of large shipments of treasure from the Atlantic cities，the absorption of coin by Government for customs，and the increased issuance of paper are recognized as causes adequate to an advarice of 30 cent within a month．＂Nothing，＂says the U．S．Economist，＂but the lopes excited by our recent successes could have prevented a much greater advance than has actnally occurred．Al things considered the balance of probability indicates a con－ tinuance of high prices rather than a speedy fall to the late low range．＂
The demand for gold，on foreign account is very great at the present time，and an increased sapply is thought indis－ pensible to Europe．The Mexican War，the Polish insur－ rection，the generally troubled condition of Enrope，the im． mense call for specie for the purchase of cotton in Egypt and India，and the increase in America of exports all combine to make the present demand for gold urgent in the extreme． There is at this moment a balance of about $\$ 65,000,000$ due the East which must be covered by remittances in specie． The recent advance of the rates of discount by the bank of England to eight per cent is mainly owing to this pressing demand．
The London Economist gives a much greater prominence to the drain of the precious metals to India and East，than does the Times．The imports of Raw Cotton from those countries during the current year，as compared with 1862 hows an excess of $\$ 80,000,000$ while the increased export of both Treasure and Merchandise in that direction is but 10 per cent of that amount．Silver is the favorite remittance to Orieutal markets，and the demand for it has，in the opinion of the Economist，been the chief cause of the pecuniary pres－ sure，which has advauced the rate of disconnt within a few months from 2 and 3 per cent perannum to 6 and 7 per cent， and 8 per cent，as we learn by the latest telegrams．The general Continental demand is ascribed by the Econess to the troubles in Poland，the disturbance in Hungary，the heavy expenses of the Turin and French Governments，and the critical condition of Germany in consequence of the unset－ tled state of the Hulstein question．Public stocks have greatly declined at London．
Raising Wreckrd Cargoes at the East．－Apropos to the question of the possibility of raising the Aquila，comes the fo lowing from a late number of the Providence， $\boldsymbol{R}$ ．I Press，of a late date：
＂The Medford Wrecking Company are pursuing their operations in this vicinity，raising the cargors of wrecked vessels．The job they are now at work on is the naising of a cargo from the wreck of a vessel which drove into West Dumpling Cove iut a storm，ten years ago，and went down in four fathoms of water．Her cargo consisted of two bun－ dred tons of heary block granite，weighing several tons each ；in the cargo were two blocks of hewn grauite，worth $\$ 500$ each．For this cargo，or such portion of it as they may be able to raise，they are to receive $\$ 4$ per tom，deliver－ ed on Long Wharf．They operate by means of divers，pro－ vided with the usual submarine armor．There are four of these who relieve each other at regular intervals of two or three hours each：Having completed this job，there are two other cargoes of granite，severally on Beaver trail and Point Judith，which they design raising．Luring the last war with Great Britian，a transport loaded with brass ordnance was sunk in the harbor of Newport，the locality of which this company will endeavor to determine by explorations，with a view of raising the guns．
Action，by the Chamber of Commerce，upon the question of raising the Aquila has been suspended，for the present， on account of the reception of a dispatch to the effect that the Government and underwriters have come to an under－ standing with regard to the question of＂liability．＂As soon as telegraph communication，which has been suspeneed for a few days，is once more opened，we may expect to see some decisive and energetic steps taken in the matter．

25,000 persons are I ngaged in Pera in obtaining india－rub－ ber to supply the foreign demand．

ENLARGEMENT AND TMPROVEMENT OF THE MENING AND SULENTIKLC PRESE．

SATURDAY，JANUARY 2． 1863.
The publighers are pleased tn announce the enlargement of this Jourual on the 2d of January next，from eight to sixteen pages－double its pres－ ent size，

## notice．

The pubitcation of the Mring and Scizatipic Press will heraafter be C．W．M．Smazi， W．B EFBr， A．T．DEwEy．

## TERMS OF SUBSCRIPTIONS．

Opon cularging our sbeet，we have determined to adbere atrictly to the advanco payment for aubseriptions，and shal！make ouly a slight advanco old pricea．Our rates，hereafler，will be as follows：－For one year，कs； \％months．$\$ 3$ ．By city carriers， 50 cents per month．

## To Advertisers．

The circulation of the I＇Ress throughout all the Bfining Districts of this tate and Nevada Terrilory，renders it a desirahle advertising medium for Hining Companies，Inventors，Patantees，Machinats，Manufucturers，Build－ atal Tradesmen．Terms reasouable and uniform， anded in at an early day．

## acramento Agency．

W．B．Rice，at the book－atore， 146 J street，between 5 th and oth，is our Ageat for Sacramento city．

## Owr Adiress．

Parties addressing this office shutd be particular to write tho nam Mming AND Sonenturic Priss＇s in full，to avoid ell liabilities of mistakes．

[^3]:    It is acknowledged by all who have examined the principles anc witaessed the operation of these Pans, that mating purposes to any other in use.
    The most important prizciple connected with the ople ration of these Pans is the separation of the trituratiog
    process from thrt of extracting the amalgam from the process from that of extracting the amalgam from the ses from the passing off of the same in combination with the quicksilver, during the proces of trituration, aud in cleaning up. By the athoduction of the Separating Pal
    to fullow the trituration this loss is entirely arolded. I to fullow the trituration this loss is entirely arolded. In
    working these machioes there is po appreciable loss quicksilver, wod hence none of the precious metals.
    Where these Pans bave been introduced and operate py the side of others on sands from the same pate, the
    Wheeler Paus have unitornly gained a large pereentage of metals over its competitorb, as well as a stlil larger Feicentage in the amount of worls performed.
    *** These Pans man be seen in daiky operation, at the
    Miner's Foundry, on First street in this cily wher at Miner's Foundry, on First street in this city, where al
    interested are invited to call and examine for whemseles nol8-tf ZENdS THEELER.
